Keywords binding affinity
References Kundu *et al.* 1998a

- Ten HIV-1 + HLA A2 asymptomatic individuals were given two courses of HIV-1 MN rgp160 vaccine over a 2 year period.
- Two hundred and fifty three HIV-1 peptides of 9 or 10 aa possessing the HLA-A2.1 binding motif (Leu at position 2, Val at the C terminus) were identified in gp160, of which 25 had a high or intermediate binding affinity.
- Eleven peptides were studied that had high HLA-A2 binding affinity – a CTL response was detected to 9/11 peptides in at least 1 individual.
- CTL responses after reimmunization may include recall responses – individuals with vaccine cross-reactive sequences prior to vaccination showed detectable CTL responses.

Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A*3303)
References Hossain *et al.* 2001; Takiguchi *et al.* 2000

- HLA-A33 a very common allele in Asia, with HLA-A*3303 the most common among the Japanese. New A*3303 epitopes were defined to better characterize the immune response in this population.
- The anchor motif for HLA*3303 (A, I, L, V, F, Y in position 2 (F and Y bind most strongly), and R (K is also tolerated) in the C-terminal position) was used to define 82 potentially reactive peptides in Env; 37/82 peptides bound to A*3303; 3/37 peptides could induce peptide-specific CTL in bulk PBMC cultures from 1/3 HLA A*3303 positive individuals tested.
- 2/3 peptides that reacted with the bulk culture, EVAQRAYR and VIEVAQRAYR, were overlapping, with one encompassing the other, but EVAQRAYR was shown to be the one that was reactive with a CTL clone.
- CTL clones were isolated that killed target cells in a concentration dependent manner after pulsing with the EVAQRAYR peptide, that could also kill cells transfected with env expressed from a vaccinia vector. Bulk cultures were tested from six additional people, and only 2/6 reacted with this peptide, but the peptide is in a highly variable region.

Keywords dynamics, immunodominance, acute/early infection, characterizing CD8+ T cells, viral fitness and reversion
References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape,within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.
- This was one of five reasonably strong responses in early infection in the patient WEAU, and the epitope sequence did not vary during the first year of the infection.

Country Barbados, Haiti, United States
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords binding affinity, immunodominance
References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, HIPRRIRQGLERALL, had an overall frequency of recognition of 16.7% - 15.3% AA, 23.1% C, 15.9% H,14.3% WI.

Assay type Cytokine production, proliferation, CD8 T-cell Elispot - IFNγ
Keywords assay standardization/improvement
References McKinnon *et al.* 2007

- The authors suggest that epitope variation has different effects on the HIV- specific immune responses of effector memory T cells (Tem) and central memory T cells (Tcm). They show a lack of correlation between IFN-gamma ELISPOT (Tem typical) and proliferation (Tcm typical) assays for specific epitopes in subjects. Since proliferating CTL also correlate with high intracellular IFN-gamma levels, they surmise that proliferating Tcm differentiate to express Tem functions.
- They also show that proliferating CTL numbers correlate with higher CD4 cell counts.
- Several patients responded strongly to epitope variants that were not part of their autologous HIV-1 sequences. Thus they suggest more comprehensive functional characterizations than the usual overnight IFN-gamma ELISPOTs as well as assessments of Tem versus Tcm specific responses rather than general CTL immune responses.
- 4 variants of this index epitope IPRRIRQGF, IF9, were tested - IPtRIRQGl, IPRRIRQGa, IPtRIRQGF, IPvRIRQGl. Variant IPRRIRQGa that is relatively rare induced a high proliferation rate in T cells. IF9 has previously published restriction to HLA-B*07.

Immunogen HIV-1 infection
Species (MHC) human (B7)
References Altfeld *et al.* 2000

- This epitope was mapped by ELISPOT in a study identifying new HLA-B60 epitopes, and was one of the epitopes presented by another HLA molecule in an HLA-B60 individual.

HXB2 Location gp160 (843–851)
Author Location gp41 (842–852)
Epitope `IPRRIRQGL`
Epitope name B7-IL9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B7)
Donor MHC A3, B7, Cw7
Keywords dynamics, supervised treatment interruptions (STI), immunodominance, acute/early infection
References Yu *et al.* 2002a

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- Only two epitopes were detected during acute infection in patient AC-06, B7 restricted gp41 epitope IPRRIRQGL and Gag GPGHKARVL. GPGHKARVL was the first targeted peptide, and remained immunodominant through the 34 month study period.
- 6/11 HLA-B7 individuals had detectable B7-restricted responses to this epitope during acute infection – 10/15 of HLA-B7 epitopes tested were targeted by at least one person during acute infection. 2/4 individuals had detectable responses to this epitope after STI.

Epitope `IPRRIRQGL`
Epitope name B7-IL9(gp41)
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B7)
Donor MHC A24, B27, B7
Keywords HAART, ART, supervised treatment interruptions (STI)
References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (`http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html`) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient C displayed the greatest response to B27-KK10(p24), and in decreasing order also responded to A24-RW8(Nef), B7-IL9(gp41), A24-RL9(gp41), A24-YL8(gp41), and B7-TM9(Nef).

Epitope `IPRRIRQGL`
Epitope name EW10
Immunogen HIV-1 infection

CTL CD8+

Species (MHC) human (B7)
Assay type Chromium-release assay, Flow cytometric T-cell cytokine assay
Keywords class I down-regulation by Nef
References Bobbitt *et al.* 2003

- Nef, through Nef-mediated MHC-1 down-regulation, is not the only viral protein to influence levels of HIV-specific CTL recognition. The Rev L60F mutation, a common natural variant, can decrease CTL recognition of late gene products. The Rev mutation impacts the early to late gene switch, reducing late gene product production (Gag, Pol, Env, Vpu, Vpr and Vif), while increasing Nef production, both of which reduce the impact CTL recognition of late gene products. As expected, Rev L60F rendered HIV infected cells more resistant to CTL that recognized epitopes from the late proteins Env and Gag. Gag expression is reduced more than Env, and Gag-specific CTL were more profoundly affected. Conversely CTL against an epitope in an early gene product, Tat, were more effeciently recognized when infected with viruses carrying the Rev L60F mutation.
- Patients in the asymptomic phase with active immune responses had more CTL resistant viruses, with lower Rev activity, lower Gag expression and greater resistance to Gag-specific CTL killing, while viruses isolated from people with AIDS were more sensitive to CTL killing.

Assay type CD8 T-cell Elispot - IFNγ
Keywords binding affinity, acute/early infection, early-expressed proteins
References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Epitope IPRRIRQGL
Immunogen HIV-1 infection
Species (MHC) human (B7)
Country Netherlands
Assay type CD8 T-cell Elispot - IFNγ
Keywords HIV exposed persistently seronegative (HEPS)
References Koning *et al.* 2004

- A high-risk seronegative group of 29 homosexual men showed reduced cellular in vitro susceptibility for HIV infection and enhanced production of RANTES compared to 15 men who went on to seroconvert. Significantly higher frequencies of HLA A*11, A*31 and Cw*15 were also found in the high risk seronegative men. Both groups of men had low frequencies of HIV-1 specific CD8+ T-cells, which may signify exposure more than protection from infection.
- 3/9 HLA B7+ infection-resistant men, compared to 0/4 pre-seroconversion men who went on to become infected, reacted to this epitope.

Epitope IPRRIRQGL
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B7)
Country United Kingdom
Assay type Tetramer binding, T-cell Elispot, Intracellular cytokine staining
Keywords rate of progression, acute/early infection, characterizing CD8+ T cells, immune dysfunction
References Papagno *et al.* 2004
- Acute HIV-1 infection induces massive activation of HIV-specific and non-HIV-specific CD8+ T-cells resulting in differentiation of these cells. High differentiation of CD8+ T-cells is correlated with disease progression. Differentiation is a natural process but it can be driven by elevated immune activation, such as in HIV infection.

Assay type CD8 T-cell Elispot - IFNγ, CD4 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords rate of progression, escape
References Oxenius *et al.* 2004b
- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses,and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0-80% as efficiently as the index peptide, and the relatively efficiency of the variant eptiopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This was one of 8 reactive epitopes found not to vary over time.

HXB2 Location gp160 (843–851)

Epitope IPRRIRQGL
Epitope name B7-IL9(gp41)
Immunogen HIV-1 infection
Species (MHC) human (B7)
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, immunodominance, early-expressed proteins
References Altfeld *et al.* 2006
- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognised epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.

Keywords subtype comparisons, variant cross-recognition or cross-neutralization
References McKinnon *et al.* 2005

- Interclade cross-reactivity of clades A, B, C, and D was tested using recombinant vaccinia-based IFN-gamma Elispot assay. 47/74 women had a positive Elispot response to at least one clade, and cross-clade responses were frequent. Clade A responses were most frequent, as expected, as clade A dominates the Kenyan epidemic (85% of the 47 women responded to clade A Env, 74% to B, 62% to C, and 43% to D). Cross-clade CD8 T-cell responses were common and directed at conserved epitopes.
- There was a greater magnitude of response to A clade peptides in individuals who responded to more than 1 clade; a 2-fold higher response was observed in clade A in 36% (9/25) of these individuals, and the response to A peptides was never lower. IPRRIRQGL responses were detected in all 4 clades in 1 woman: clade A gave a high response; IPRRIRQGL was identical clade B; clade C and D had lower responses and carried variant peptides IPRRIRQGf and IvRRIRQGL.

References Kemal *et al.* 2008

- An LTNP was followed longitudinally over 6 years and 3 sampling time points, until transition to disease. His HLA were heterozygous and not associated with nonprogressive infection, but 3 alleles were associated with poor clinical prognosis. No attenuating mutations in initial samplings, but an insertion in the V2 loop and continuing CCR5 coreceptor use were found.
- A decrease in IFN-gamma response was seen over time, suggesting CTL dysfunction. An increase in T-cell epitopes targeted (e.g. emergence of YL8, YLKDQQLL and WY20, WKFDSRLAFHHMARELHPEY variants and gain of response to EL9, EIKDTKEAL, NL10, NSNPDCKTIL, AK9, AIFQSSMTK, WM8, WSMVRERM, VT15, WVHHTQGYFPDWQNYT) was seen concomitant with disease progression, reflecting viral replication and/or variants.
- HLA-B8-restricted epitope RRIRQGLERILL elicited increasing CTL responses at the last 2 time points. HLA restriction was predicted in this study based on the patient's HLA alleles and previous publication.

Epitope `RIRQGLERA`
Immunogen HIV-1 infection
Species (MHC) human (A*0205)
Keywords escape, optimal epitope
References Liang *et al.* 2008

- 1100 unique full-length Env sequences were analyzed and the positive selection (PS) pressure determined. The QUASI method was used across Clades A, B, C and D, to find PS sites dispersed across Env.
- Frequency of PS sites is stable over time.
- 25% to 61% PS sites are shared between subtypes A, B, C and D, so it is inferred that immune responses are targeted against the same general regions.
- Significant correlations between PS sites and neutralizing antibody response, helper response, antibody plus CTL response are found. This suggests that the NAb response might be the driving force behind HIV-1 Env evolution.
- PS-free sites that are targeted greatly by NAb and CTL were found. Functional reasons for the lack of positive selection in such regions must exist.
- PS-site-rare regions (conserved regions of Env) were examined for PS, and epitopes located in such regions. Epitope RIRQGLERA, restricted by HLA-A*0205 is on a region free from positive selection. It is found in Kenyan populations and is associated with low transmission of HIV.

Epitope `RIRQGLERA`
Epitope name A0205-RA9(gp41)
Immunogen HIV-1 infection
Species (MHC) human (A2)
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, immunodominance, early-expressed proteins
References Altfeld *et al.* 2006

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognised epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.

HXB2 Location gp160 (846–854)

Assay type CD8 T-cell Elispot - IFNγ
Keywords binding affinity, acute/early infection, early-expressed proteins
References Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

Species (MHC) human (A2, B8)
Keywords vaccine-induced epitopes
References Ferrari *et al.* 2001

- Different HIV strains were used for different regions: gp41 LAI, Gag LAI, gp120 MN, gp120 SF2
- No HLA-A*0201 or B8 responses were made against the Env vaccine in individuals carrying these alleles, despite these being common presenting molecules for CTL responses to natural infections.

HXB2 Location Env
Author Location Env
Epitope
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B*35)
Keywords rate of progression
References Jin *et al.* 2002

- Patients with HLA-B*35 variants B*3502, B*3503, B*3504, and B*5301 tend to proceed to AIDS more quickly than those with B*3501.
- Of 32 patients with HLA-B*35 alleles CD8+ CTL responses were quantified using an intracellular cytokine staining assay – 75% had responses to Pol, 69% to Gag, 50% to Nef, and 41% to Env.
- The overall magnitude of CTL responses did not differ between those bearing B*3501 and the others. A higher percentage of Gag responses was observed in those that had lower RNA levels that carried B*3501, and there was a negative association with viral load and CTL activity. The data is consistent with higher levels of CTL responses contributing to protection in B*3501 individuals, but not in B*3502, B*3503, B*3504, and B*5301 individuals.

Immunogen HIV-1 exposed seronegative
Species (MHC) human
Keywords review, HIV exposed persistently seronegative (HEPS)
References Rowland-Jones *et al.* 2001

- This is a review that summarizes observations about HIV-specific CTL found in the HIV-1 exposed persistently seronegative (HEPS) population.

- The CTL responses assayed by ELISPOT and by CTL precursor frequencies by limiting dilution analysis indicate that CTL in HEPS individuals tend to be of a lower magnitude than in chronic HIV-1 infections – the responses in HEPS cases are below the level of detection by tetramer assays.
- CD8+ CTL responses tend to be detectable in HEPS subjects only if they are recently exposed, and the response diminishes if exposure is reduced – it is not clear if there is a stable memory population in HEPS cases.
- CD8+ CTL responses in the HEPS population are associated with HIV-1 specific CD4+ T cell responses, assayed by proliferation assays, IL-2 secretion, and ELISPOT, and the authors consider the possibility that HIV-1-specific T-help responses improve the "quality" of the CD8+ response in HEPS individuals relative to HIV-1 infected individuals, who tend to have a poor HIV-1-specific T-help response.
- HIV-1 specific CD8+ CTL responses in HIV-1 infected individuals show reduced levels of perforin, and the T cells may not mature properly, and although similar studies have not been conducted in HEPS individuals this is considered as a possible difference in the CTL immune response in HEPS and HIV-1 infected people.

Keywords epitope processing, escape
References Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found in highly variable regions in Nef, Env, and p17.
- While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.
- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.

Vector/Type: DNA *Strain:* B clade NL43 *HIV component:* Env
Species (MHC) macaque
References Akahata *et al.* 2003

CTL CD8+

- Four monkeys were injected i.m. with a SHIV plasmid (SHIV-NM-3rn ZF1*) which encodes all viral proteins driven by the SIV LTR promoter. Infectivity is prevented by the introduction of mutations within the zinc-finger motifs of the nucleocapsid (NC) that prevents RNA packaging. An original NC ZF1 mutant plasmid was constructed using NL43 (Akahata 275:116-124 (2000) – the SHIV construct was made as an alternative to get improved expression in macaques using an SIV promotor. CTL were detected by lysis of HIV-1 Env IIIB or SIV Gag mac239 expressing expressing target cells, and a T cell proliferative response to Env was observed. Env-directed antibodies were detected by ELISA. All vaccinated macaques had a low peak viral loads that fell below the level of detection within 6 weeks post-challenge with autologous SHIV SHIV-NM-3rn.

Immunogen
Species (MHC) human
Assay type Flow cytometric T-cell cytokine assay
Keywords subtype comparisons
References Currier *et al.* 2003

- CD8-cellular immune responses from 21 HIV-1 infected patients from Kenya infected with subtype A, C, D, and unique recombinants were studied for cross-recognition of Gag, Env, and Nef vaccinia-expressed proteins representing subtypes A-H, including CRF01.
- Both subtype-specific and cross-reactive CTL were observed, with a skewing of responses towards the infecting subtype in the nine subjects with full length sequence available. The magnitude of the responses to Gag were the highest, less to Nef, and still less to Env.
- For Gag, 8/21 subjects responded to at least 7/8 different subtype proteins, 7 had a mixed response, recognizing some subtypes but not others, and 6 responded to only one or none of the different subtype proteins. For Env, 4/19 subjects responded to at least 7/8 subtypes, 8 had a mixed response, and 7 responded to one or none. For Nef, 5/19 subjects responded to at least 7/8 subtypes, 8 had a mixed response, and 6 responded to one or none.

Vector/Type: protein, peptide in liposome *Strain:* B clade IIIB *HIV component:* gp140, gp160, oligomeric gp140 *Adjuvant:* CpG immunostimulatory sequence (ISS), liposome
Species (MHC) mouse
Donor MHC H-2d
Assay type Cytokine production, proliferation, Chromium-release assay
Keywords Th1, Th2, adjuvant comparison, vaccine antigen design
References Rao *et al.* 2004

- Administration of ogp140 in liposomes containing lipid A (LA) induces high antibody titers which are increased by adding CpG ODN. Priming and boosting of BALB/c mice with ogp140+LA induces mixed Th1/Th2 immune response, while adding CpG ODN switches the immune response to a Th1 type. Mixing ogp140 with lipomoses containing lipid A yielded excellent proliferative and CTL specific responses; CpG did not affect CTL responses. The antigen did not need to be encapsulated in the liposome to induce strong responses with LA as an adjuvant.

Species (MHC) macaque
Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding, CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords vaccine-specific epitope characteristics, vaccine antigen design
References Sadagopal *et al.* 2005

- 22/23 macaques that were immunized with a DNA prime SHIV-89.6 and boosted with rMVA showed successful control of viremia, with low or undetectable viral loads and normal CD4 counts 200 weeks postchallenge. IFN-gamma producing T cells were found in unexpectedly low breadths and frequencies. T-cell responses were stable over time and maintained their production of IFN-gamma and IL-2. Long-term control was found in macaques of diverse histocompability types. The CD8 T cells seemed to have the most impact on well-contained chronic infections in the vaccinated and challenged animals.
- Both CD4 and CD8 responses were found to the SIV Gag and HIV Env proteins; 60% of CD8+ epitopes and 80% of CD4+ epitopes were in p27.

Keywords vaccine antigen design
References Mercier *et al.* 2007

- 3 rhesus macaques were given oral immunizations with an enteric-coated mixture of adenoviral vectors expressing HIV-1 gag and a string of conserved env peptides representing broadly cross-reactive CD4+ and CD8+ epitopes. The macaques were boosted intranasally with a mixture of 6 HIV-1 envelope peptides plus cholera toxin adjuvant.
- The immunizations increased cellular immune responses, including antigen-specific IFNgamma-producing CD4+ and CD8+ effector memory T cells in the intestine. After only the oral immunization, there were no EliSpot responses to env peptides or to gag. After the intranasal boost, EliSpot responses against env peptides and against inactivated HIV were markedly increased, but gag responses were not.

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* B clade
Species (MHC) macaque
Assay type Intracellular cytokine staining
Keywords subtype comparisons, vaccine antigen design
References Smith *et al.* 2005

- Macaques were immunized with a clade B HIV vaccine and tested for responses to pools of clade B and A/G Env and Gag peptides. While CD4 responses were more frequent than CD8 responses, higher cross-clade responses were found for CD8 responses. The authors suggest that the better cross-clade reactivity of the CD8 responses reflects the size difference between CD8 and CD4 epitopes; the smaller CD8 epitopes provide a smaller target for mutation.
- For both B and A/G Env and Gag peptides, 3/5 pools produced CD8+ T cells, suggesting the existence of 2 or 3 cross-reactive CD8 epitopes.

Assay type CD8 T-cell Elispot - IFNγ
Keywords escape, immune evasion, optimal epitope
References Liu *et al.* 2006b

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.
- This is a newly defined epitope. Positions 4 and 6 in the epitope had potentially experienced positive selection. WSKtSIIGW and WSKSSmIGW escape variants were found.

Assay type CD8 T-cell Elispot - IFNγ
Keywords computational epitope prediction, vaccine-induced epitopes
References Li *et al.* 2006b

- To assess the efficiency of vacine-elicited T-cell responses to epitopes in circulating strains of HIV-1 rather than to consensus or ancestor epitope sequences, the authors used potential T-cell epitopes (PTEs) from Gag, Pol, Nef and Env proteins, to construct an epitope prediction model for peptide selection. Evaluation in their method was conducted by testing Nef-specific CTL responses in four HIV-1 subtype B infected subjects. It was found that peptides autologous to HIV-1 immunogen sequence were the best for vaccine design and that vaccine response evaluation was better performed using peptide sets from circulating strains of HIV-1.
- SVVGWPaVRERMRRA is a previously unpublished epitope that varies from the consensus at position 7.

Assay type CD8 T-cell Elispot - IFNγ
Keywords HAART, ART, mother-to-infant transmission, rate of progression, co-receptor, immune evasion, HLA associated polymorphism
References Reinis *et al.* 2007

- HIV-1 mother-to-child transmission is studied for LTNPs by comparing entire genomes from 2 mother (M1, M2) and 2 daughter (D1, D2) RNA samples of a mother-child pair over 11 years. Genetic distance was 94% between subjects' strains. Divergence in sequences was attributed to distinct HLA selection pressures as ds/dn was larger for intra- rather than interperson sequences. 10 new mutations in D2 were found related to unique daughter HLA alleles.
- Functional ELISpot studies using D2 and Nef peptides reveal strong associations between CTL responses and escape variants, contributing to delayed progression.
- LTNP status was not related to defective virus since all viral genes were intact and CTL response did not effectively control viral load. It is supposed that genetic HLA background and HIV-1 epitope-immune response interaction account for nonprogression of disease.
- All isolates contained R77Q in Vpr, a variation associated with reduction of cellular apoptosis.

- This Nef overlapping peptide, SVVGWPTVRERMRRA was mutated in the daughter D2 isolate to SiVGWPaVRdRMRRA.

Assay type CD8 T-cell Elispot - IFNγ, HLA binding
Keywords escape, acute/early infection
References Milicic *et al.* 2005
- CTL responses and escape were analyzed in 4 homosexual couples where blood samples were available within weeks of estimated transmission. When the recipient had the same HLA type as the donor, CTL escape variants prevented a CTL response to those epitopes in the recipient. Even when the HLA alleles were different in the transmitting couple, a single escape mutation in one epitope can abolish CTL recognition of an overlapping epitope of distinct restriction in the recipient. In an early acute infection of the donor, the precise timing of transmission determines the viral variants transmitted.
- The recipient mounted an acute CTL response to this epitope, and the escape variant wpAvrKrm emerged in the recipient soon after.

Assay type CD8 T-cell Elispot - IFNγ
Keywords responses in children, mother-to-infant transmission, escape, acute/early infection, viral fitness and reversion
References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness.
- Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- The variant WnTVRERM was present in 10/10 clones from a B8+ mother, was transmitted to her B8- infant, and present in 10/10 clones at months 2, 4, and 15.

HXB2 Location Nef (13–20)

Epitope WPTVRERM
Epitope name B8-WM8(Nef)
Immunogen HIV-1 infection
Species (MHC) human (B8)
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, immunodominance, early-expressed proteins
References Altfeld *et al.* 2006

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognised epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.

Keywords characterizing CD8+ T cells
References Streeck *et al.* 2008a

- T-cells were studied for exhaustion and dysfunction in chronic HIV infection. Polyfunctionality of CTL immune response to HIV-1 decreased with persistence of antigen presence over time in chronic infection. CTL exhaustion can thus be halted by reduction in viral antigen load - either by ART or through escape mutations.
- PD-1, marker for activation and apoptosis increases over time, but it decreases when epitope mutations develop. CD127 however, is not impacted by viral escape.
- 126 days after first testing, epitope WPTVRERM showed no variation in a treated patient. Previously published HLA-restriction for WM8 is HLA-B8.

Assay type CD8 T-cell Elispot - IFNγ, Other
Keywords rate of progression, immune evasion
References Kemal *et al.* 2008

- An LTNP was followed longitudinally over 6 years and 3 sampling time points, until transition to disease. His HLA were heterozygous and not associated with nonprogressive infection, but 3 alleles were associated with poor clinical prognosis. No attenuating mutations in initial samplings, but an insertion in the V2 loop and continuing CCR5 coreceptor use were found.
- A decrease in IFN-gamma response was seen over time, suggesting CTL dysfunction. An increase in T-cell epitopes targeted (e.g. emergence of YL8, YLKDQQLL and WY20, WKFDSRLAFHHMARELHPEY variants and gain of response to EL9, EIKDTKEAL, NL10, NSNPDCKTIL, AK9, AIFQSSMTK, WM8, WSMVRERM, VT15, WVHHTQGYFPDWQNYT) was seen concomitant with disease progression, reflecting viral replication and/or variants.
- HLA-B8-restricted epitope WSMVRERM was able to elicit CTL response only by the last time point. HLA restriction was predicted in this study based on the patient's HLA alleles and previous publication.

Assay type CD8 T-cell Elispot - IFNγ
Keywords HAART, ART, mother-to-infant transmission, rate of progression, co-receptor, immune evasion, HLA associated polymorphism
References Reinis *et al.* 2007

- HIV-1 mother-to-child transmission is studied for LTNPs by comparing entire genomes from 2 mother (M1, M2) and 2 daughter (D1, D2) RNA samples of a mother-child pair over 11 years. Genetic distance was 94% between subjects' strains. Divergence in sequences was attributed to distinct HLA selection pressures as ds/dn was larger for intra- rather than interperson sequences. 10 new mutations in D2 were found related to unique daughter HLA alleles.
- Functional ELISpot studies using D2 and Nef peptides reveal strong associations between CTL responses and escape variants, contributing to delayed progression.
- LTNP status was not related to defective virus since all viral genes were intact and CTL response did not effectively control viral load. It is supposed that genetic HLA background and HIV-1 epitope-immune response interaction account for nonprogression of disease.
- All isolates contained R77Q in Vpr, a variation associated with reduction of cellular apoptosis.
- This Nef overlapping peptide, WPTVRERMRRAEPAA was mutated in the daughter D2 isolate to WPaVRdRMRRAEPAA.

HXB2 Location Nef (15–23)

Immunogen HIV-1 infection, peptide-HLA interaction
Species (MHC) human
Assay type CD8 T-cell Elispot - IFNγ
Keywords immunodominance
References Rolland *et al.* 2007b

- Resemblance between viral and host peptides may preclude immune reactivity against such epitopes. This was shown using ELISpot to test recognition against the entire viral genome in 314 HIV-infected subjects. Also, 944 overlapping Nef variants were tested for 30 patients. This inverse relationship between similarity of HIV epitope to host proteome and its immunogenicity has implications in vaccine design.
- Other factors, however, like entropy effects and forbidden residue usage or even hydrophobicity or disorder prediction scores were more influential than this similarity to self, with regards to immunogenicity of HIV-1. Also, forbidden aa ratios at the C-terminus of CTL epitopes and similarity to host proteins are positively correlated. Low disorder peptides elicit broader CTL responses and are better recognized.
- This HIV-1 epitope, TVRERMRRA, is similar to human protein Rhomboid protein, sequence TTVRsRMRRA.

Keywords HLA associated polymorphism
References Brumme *et al.* 2008a

CTL CD8+

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-B*15-associated substitutions within optimally defined epitope RMRRAEPAA are at positions R3 and A5, RMrRaEPAA.

References Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords rate of progression, acute/early infection, memory cells
References Sabbaj *et al.* 2007

- CD127 hi memory CTLs were correlated with different patient groups - subjects with chronic HIV-1 infection or controllers or those treated early with ART. For patients with chronic infection, CD127 hi CTL levels decrease greatly. Early ART treatment alone maintained these long-lived memory T cells.
- In response to peptide GI-15, IFN-gamma and IL-2 were produced by CD127 hi cells in patients given early ART . TNF-alpha was secreted by CD127 lo cells. Longitudinally, in one patient, IFN-gamma was secreted by both CD127 hi and lo cells before treatment but was maintained in CD127 hi cells after treatment. CD127 hi cells were responsible for producing IL-2 and TNF-alpha after ART.

References Liang *et al.* 2002

- BALB/c, C3H/HeN and C57BL/6 mice were given intramuscular immunization with Nef DNA constructs – C57BL/6 responded to this epitope.

- The Nef mutant that lacked the myristylation site (G–>A) at position 2, and the dileucine motif (L –> A at positions 174 and 175) was impaired in terms of its ability to elicit induction of Nef-specific CD4+ and CD8+ T-cell responses. The myristylation site is critical for Nef membrane localization and function, and the di-leucine motif for the down-regulation of surface CD4 molecules, and the mutation of these regions could yield a safer vaccine.
- N-terminal addition of human tissue plasminogen activator (TPA) to Nef, enhanced CD8+ T-cell responses and could compensate for the G2A, L174A, L175A mutations – this enhanced immunogenicity correlated with enhanced levels of protein expression in transfected cells.

Keywords escape, viral fitness and reversion
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- People who carried B45 tended to carry a variant of this epitope, while people who did not almost always carried the consensus form.
- B*4501 was one of the HLA types associated with having a high viral load.

References Zhao *et al.* 2007

- 46 ART-naive subjects with HIV-B infection were used to study CTL cross-responses between HIV clade B and C peptide sequences. 204/826 overlapping peptide epitopes tested were common between both clades in eliciting CTL responses that were of similar magnitude and frequency in both HIV-B and -C. Higher magnitudes and frequencies of responses were detected with peptides from Gag, Pol, Env and Nef proteins, while peptides from Rev, Vif, Vpu, Vpr and Tat were recognized less often.
- 27 peptides from immunodominant regions of higher inter-clade homology in Gag, Nef, Pol, Vpr, Env and Vif were found to be common between both clades in eliciting the greatest CTL responses. Although these 27 peptides differed by up to 39% between clades, CTL responsiveness was not affected.
- Cross-recognized peptides had a lower entropy of recognition than clade-B specific variants, suggesting that published conserved clade-B sequences are also more conserved between clades. Consensus sequences therefore occurred in virus regions of low intra-clade entropy and high inter-clade homology.
- 18/27 highly immunogenic clusters were previously reported by Frahm et al. [J. Virol. 78:2187-2200 (2004)].
- This peptide, EVGFPVRPQVPLRPMTyK differs from the consensus C sequence EVGFPVRPQVPLRPMTfK at 1 amino acid position, i.e. by 5.6%.

References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The

virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- EVGFPVRPQVPLRPMTYK is the most frequently targeted across ethnicities. It is immunodominant, and had an overall frequency of recognition of 44.7% - 52.5% AA, 50% C, 34.1% H, 38.1% WI. This peptide is included in a 58 aa Nef highly reactive region to be used for vaccine design. It is also part of 'Region I', EVGFPVRPQVPLRPMTYKAAVDLSHFLKEKGGLEGLIYSQK, a 41 aa region recognized by >90% of subjects across ethnic groups.

Keywords escape, HLA associated polymorphism
References Brumme *et al.* 2008a
- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-B*07-associated substitution within optimally defined epitope FPVTPQVPL is at position T4, FPVtPQVPL. FL9 has a very low recognition frequency and only 1 recorded escape.

Assay type CD8 T-cell Elispot - IFNγ
Keywords acute/early infection, variant cross-recognition or cross-neutralization, superinfection
References Yang *et al.* 2005b

- An individual infected with a drug-resistant strain of HIV-1 subtype B with controlled viremia became superinfected with another subtype B strain. The second strain outgrew the first despite lower replication capacity and the same viral phenotype. The strains showed differences in their epitope sequences. The CTL responses to the first strain declined after superinfection, followed by some adaptation of targeting to the new epitopes of the second strain. Differences in the recognized epitopes were suggested to have contributed to the poor immune containment of the second strain.
- This epitope FPVRPQVPL was identical in the initial and superinfecting strains, and the CTL response persisted in the patient before and after superinfection.

Keywords vaccine-specific epitope characteristics, cross-presentation by different HLA, HLA associated polymorphism
References Reche *et al.* 2006

- 25 CTL epitopes with sequence conservation were studied. Population protection coverage (PPC) for 5 different ethnic groups in the US was estimated by combining HLA binding

predictions and known HLA frequencies. HIV-1-naive individuals mounted a better response to the epitope pools than HIV-1 infected individuals.
- A more detailed evaluation of HIV-naive T-cell responses was undertaken, limiting the study to only those peptides that are restricted to A*0201. Though the peptides could cross-recognize and bind different HLA, they were able to specifically lyse only cells of the same (A*0201) HLA-restriction. Thus, the CTL response was less degenerate than peptide binding to MHC.
- In addition to published restriction above, epitope FPVRPQVPL was predicted to be restricted by HLA A*2902, B*0702, B*3501, B*5101, B*5102, B*5103, B*5301 and B*5401.

CTL CD8+

- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)
- 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.
- Subjects with chronic HIV-1 infection recognized between 2-8 out of 11 B7-restricted epitopes.
- An acute seroconvertor homozygous for the B7 allele recognized five B7-restricted epitopes.
- The other acute seroconvertor failed to recognize any of the 11 B7-restricted epitopes tested.
- The B7-restricted CTL response was highly variable and there was no clearly dominant epitope.

Species (MHC) human (B7)
References Ferrari *et al.* 2000

- One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.

HXB2 Location Nef (68–77)
Author Location Nef (68–77 SF2)
Epitope FPVTPQVPLR
Immunogen HIV-1 infection
Species (MHC) human (B7)
Keywords HAART, ART, acute/early infection
References Altfeld *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-B7+ individuals that had a CTL response to this epitope broken down by group: 0/4 group 1, 0/3 group 2, and 1/1 group 3.

Epitope FPVTPQVPLR
Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (B7)
Keywords HIV exposed persistently seronegative (HEPS)
References Kaul *et al.* 2001a

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Subject ML 1203 started with CTL responses to A*6802 DTVLEDINL and to B7 FPVTPQVPLR prior to seroconversion, and upon seroconversion acquired additional responses to A*6802 ETAYFILKL which became dominant, B7 TPGPG(V/I)RYPL, B7 IPRRIRQGL, and B7 SPRTLNAWV.

HXB2 Location Nef (68–77)
Author Location Nef (68–77)
Epitope FPVTPQVPLR
Immunogen HIV-1 infection
Species (MHC) human (B7)
Keywords rate of progression, acute/early infection
References Day *et al.* 2001

- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)
- 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.
- Subjects with chronic HIV-1 infection recognized between 2-8 out of 11 B7-restricted epitopes.
- An acute seroconvertor homozygous for the B7 allele recognized five B7-restricted epitopes.
- The other acute seroconvertor failed to recognize any of the 11 B7-restricted epitopes tested.
- The B7-restricted CTL response was highly variable and there was no clearly dominant epitope.

HXB2 Location Nef (68–77)
Author Location Nef (68–76)
Epitope FPVTPQVPLR
Immunogen HIV-1 infection
Species (MHC) human (B7)
Donor MHC A3, B7, Cw7
Keywords dynamics, supervised treatment interruptions (STI), acute/early infection

References Yu *et al.* 2002a

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- 0/11 HLA-B7 individuals had detectable B7-restricted responses to this epitope during acute infection – 10/15 of HLA-B7 epitopes tested were targeted by at least one person during acute infection. Also, none of 4 individuals had detectable responses to this epitope after STI.

HXB2 Location Nef (68–77)
Author Location Nef (66–75)
Epitope FPVTPQVPLR
Immunogen HIV-1 infection
Species (MHC) human (B7)
Country Spain
Assay type proliferation, CD8 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords HAART, ART, supervised treatment interruptions (STI), immune dysfunction
References Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load.
- Less than 2 of 7 patients recognized this epitope.

HXB2 Location Nef (68–77)
Author Location Nef (68–77)
Epitope FPVRPQVPLR
Epitope name FR10
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B7)
Country United States
Assay type CD8 T-cell Elispot - IFNγ
Keywords assay standardization/improvement, acute/early infection, immune evasion
References Malhotra *et al.* 2007a

- The ability of T cells from early infected subjects to recognize Nef clade B HIV-1 epitope variants was tested using both a consensus peptide panel and a standardized potential T-cell epitope panel (PTE-B). The magnitude and breadth of PTE-optimized peptide panels was significantly higher than CON peptides'. 29 potential epitopic domains were detected in Nef using the PTE peptide set.
- A CON peptide, EVGFPVRPQVPLR contained the epitope FPVRPQVPLR (FL10) and elicited an IFN-gamma immune response.
- HLA-B07 restriction for FR10 was presumed based on the subject's having the HLA allele and publication in the Los Alamos database.

HXB2 Location Nef (68–77)

Assay type CD8 T-cell Elispot - IFNγ
Keywords HAART, ART, mother-to-infant transmission, rate of progression, co-receptor, immune evasion, HLA associated polymorphism
References Reinis *et al.* 2007

- HIV-1 mother-to-child transmission is studied for LTNPs by comparing entire genomes from 2 mother (M1, M2) and 2 daughter (D1, D2) RNA samples of a mother-child pair over 11 years. Genetic distance was 94% between subjects' strains. Divergence in sequences was attributed to distinct HLA selection pressures as ds/dn was larger for intra- rather than interperson sequences. 10 new mutations in D2 were found related to unique daughter HLA alleles.
- Functional ELISpot studies using D2 and Nef peptides reveal strong associations between CTL responses and escape variants, contributing to delayed progression.
- LTNP status was not related to defective virus since all viral genes were intact and CTL response did not effectively control viral load. It is supposed that genetic HLA background and HIV-1 epitope-immune response interaction account for nonprogression of disease.
- All isolates contained R77Q in Vpr, a variation associated with reduction of cellular apoptosis.
- This Nef overlapping peptide, PVRPQVPLRPMTYKA was mutated in the daughter D2 isolate to PVRPQVPLRPMTfKA.

HXB2 Location Nef (70–84)
Author Location Nef (70–84 HXB2)
Epitope VTPQVPLRPMTYKAA
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Assay type T-cell Elispot
Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 34% of the study subjects, and it was the second most frequently recognized peptide.

Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B*07)
Country Australia, Canada, Germany, United States
Keywords escape, HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- Escape (and reversion) rates for B*57-restricted epitopes were highest for Gag-TW10 (TSTLQEQIGW) > RT-IW9 (IVLPEKDSW) > Nef-YY9 (YTPGPGIRY) > Nef-HW9 (HTQGYFPDW) > Gag-IW9 (ISPRTLNAW) > Gag-KF11 (KAFSPEVIPMF) .

References Frater *et al.* 2007

- To study whether CTL responses restricted by "good" HLA I molecules exert stronger immune selection than other HLA I molecules, 54 and 70 optimal epitopes within HIV-1 Gag, Pol and Nef genes for Caucasian and African cohorts were tested in patients over a mean of 14 months. "Good", advantageous HLA allele-restricted epitopes were much more polymorphic than epitopes restricted by other, non-advantageous HLA in patients, suggesting that benefits associated with HLA Class I alleles of elite controllers of disease progression are epitope-specific. Such "driver" epitopes with high polymorphism had high frequency of immune response, allowing them to be ranked for recognition and polymorphism.
- Patients with higher proportions of mutated epitopes also had lower plasma viral loads, and mean epitope variability correlated negatively with relative hazard of disease progression.
- Variant RPQVPvRPM at position 6 was the predominant polymorphism found.

Country United States, South Africa
Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding
Keywords memory cells
References Wherry *et al.* 2006

- Cohorts of HIV-infected subjects from the US and South Africa were screened for CD8+ EliSpot responses. Tetramer assays were performed for 13 frequently targeted HIV epitopes and compared to Flu, vaccinia, and EBV epitopes assayed in non-HIV-infected subjects. HIV tetramer+ CD8 T cells expressed less CD127, and this reduction was pervasive across all epitopes and alleles tested. These results indicated impaired HIV-specific memory CD8 T cell differentiation, regardless of level of control of viremia, epitopes targeted, or HLA alleles.

Epitope TPQVPLRPM
Immunogen HIV-1 infection
Species (MHC) human (B7)
Keywords HAART, ART, acute/early infection
References Altfeld *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-B7+ individuals that had a CTL response to this epitope broken down by group: 0/4 group 1, 0/3 group 2, and 1/1 group 3.

Epitope TPQVPLRPM
Immunogen HIV-1 infection
Species (MHC) human (B7)
Keywords rate of progression, acute/early infection
References Day *et al.* 2001

- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)
- 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.
- Subjects with chronic HIV-1 infection recognized between 2-8 out of 11 B7-restricted epitopes.
- An acute seroconvertor homozygous for the B7 allele recognized five B7-restricted epitopes.
- The other acute seroconvertor failed to recognize any of the 11 B7-restricted epitopes tested.
- The B7-restricted CTL response was highly variable and there was no clearly dominant epitope.

Donor MHC A3, B7, Cw7
Keywords dynamics, supervised treatment interruptions (STI), acute/early infection
References Yu *et al.* 2002a

CTL CD8+

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- 0/11 HLA-B7 individuals had detectable B7-restricted responses to this epitope during acute infection – 10/15 of HLA-B7 epitopes tested were targeted by at least one person during acute infection. 2/4 individuals had detectable responses to this epitope after STI.

HXB2 Location Nef (71–79)

Epitope `TPQVPLRPM`
Epitope name B7-TM9(Nef)
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B7)
Donor MHC A32, B14, B7; A24, B27, B7
Keywords HAART, ART, supervised treatment interruptions (STI)
References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (`http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html`) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient A displayed the greatest response to epitope B14-EL9(gp41), a strong response to B7-TL9(p24), and responses to B7-TM9(Nef) and A32-PW10(RT). Patient C displayed the greatest response to B27-KK10(p24), and in decreasing order also responded to A24-RW8(Nef), B7-IL9(gp41), A24-RL9(gp41), A24-YL8(gp41), and B7-TM9(Nef).

Epitope `TPQVPLRPM`
Epitope name B7-TM9(Nef)
Immunogen HIV-1 infection
Species (MHC) human (B7)
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, immunodominance, early-expressed proteins
References Altfeld *et al.* 2006

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognised epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.

HXB2 Location Nef (71–79)

Author Location Nef (C consensus)
Epitope RPQVPLRPM
Subtype C
Immunogen HIV-1 infection
Species (MHC) human (B*0702, B*4201, B*8101, B7, B81)
Country South Africa
Assay type CD8 T-cell Elispot - IFNγ
Keywords escape, cross-presentation by different HLA
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- People who carried either B07 or B81 tended to carry a variant of this epitope, while people who did not almost always carried the consensus form.
- B*4201 may also present this epitope, as the allele is enriched in people who react with the peptide that contains the epitope, and it is known from the database to be also presented by B*4201.

Epitope RPQVPLRPM?
Epitope name RM9
Immunogen HIV-1 infection
Species (MHC) human (B81)
Country United States, South Africa
Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding
Keywords memory cells
References Wherry *et al.* 2006

- Cohorts of HIV-infected subjects from the US and South Africa were screened for CD8+ EliSpot responses. Tetramer assays were performed for 13 frequently targeted HIV epitopes and compared to Flu, vaccinia, and EBV epitopes assayed in non-HIV-infected subjects. HIV tetramer+ CD8 T cells expressed less CD127, and this reduction was pervasive across all epitopes and alleles tested. These results indicated impaired HIV-specific memory CD8 T cell differentiation, regardless of level of control of viremia, epitopes targeted, or HLA alleles.

Immunogen HIV-1 infection
Species (MHC) human
Country South Africa
Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding, Other
Keywords supertype, escape, cross-presentation by different HLA, TCR usage, HLA associated polymorphism
References Leslie *et al.* 2006

- 14 promiscuous HIV-specific CTL epitopes presented by B7 supertype alleles were described. It was shown that CTLs targeting an identical epitope that are restricted by closely related but different HLA alelles differ in several ways: by occurrence of distinct HLA-specific escape mutations, by recruitment of distinct TCRs by peptide/MHC complexes, and by functional avidity of CTLs. Since there were no differences in the frequency, magnitude or immunodominance of the CTL responses restricted by different HLA alleles, it is suggested that the unique peptide/MHC complexes generated by closely related HLA induce qualitatively different CTL responses.
- Functional avidity is correlated with selection pressure observed in HLA allele-epitope restriction.
- For this epitope, RM9, selection pressure was evidenced by studying changing epitope variants associated with HLAs of the B7 supertype.
- Higher level of sequence variation and escape mutations were associated with the B*8101 and B*0702 alleles.
- Statistically significant associations between numbers of HLA-B8101, -0702 and -B4201 expressing subjects and epitope RPQVPLRPM were found.
- In 3 B-supertype alleles studied, B*4201, B*8101 and B*0702, two RM9 variants were most common - one at the first position, kPQVPLRPM and the other at the sixth position, RPQVPvRPM. Several more variants are listed in the paper.

Keywords subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance
References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

CTL CD8+

- Bioinformatic prediction using NetCTL 1.0, Episelect and NetMHCpan generated 184 CTL epitopes from Gag, Pol, Nef, Env and Tat in HIV subtypes A, B, C, D and CRF01_AE, restricted by MHC A1, A2, A3, A24, B7, B44 and B58. 45 of the 114 epitopes recognized experimentally in subjects were novel, and an elite subgroup comprising 21 epitopes were recognized by at least 13% of patients tested.
- Response magnitude was high—Gag and Nef, Env, Tat in descending order). While Gag, Pol, Env and Nef were highly immunocgenic, only 38% Tat epitopes elicited a response.
- 4 patterns of cross-subtype recognition found were (a) conserved epitopes recognized by patients infected with several HIV subtypes (b) infrequently found reference epitopes recognized by patients infected with several HIV subtypes (c) epitopes more prevalent in certain subtypes recognized by patients infected with several subtypes (d) rarely, subtype-specific epitopes unable to elicit cross-clade recognition
- Conserved epitope QVPLRPMTY was recognized by at least 4 patients with restricting HLA supertype and infected with several HIV subtypes. Predicted HLA restriction for this epitope was to suptertype A1.

Epitope QVPLRPMTYK
Immunogen peptide-HLA interaction
Species (MHC) human (A*03)
Assay type Tetramer binding
Keywords binding affinity
References Gillespie *et al.* 2007

- MHC can exert a protective effect on HIV-1 disease progression by the interaction of MHC Class I molecules with Killer Inhibitory Receptors (KIR) of the innate immune system. Here, KIR3DS1, a putative stimulatory receptor and allele of the inhibitory KIR3DL1, is studied. Bw4 MHC Class I proteins were implicated in this KIR's ligand specificity, but the authors were unable to generate binding of Bw4Ile80 tetramers in complex with epitopes to KIR3DS1 transiently expressed on 293-T cells, using a panel of HIV-epitopes differing at p7 and p8.
- This epitope, QVPLRPMTYK (MHC Class I restriction, serotype Bw6) complexed with MHC A03 as a tetramer was unable to bind KIR3DS1 at 4, 20 and 37C.

Epitope QVPLRPMTYK
Immunogen HIV-1 infection
Species (MHC) human (A*0301)
Keywords acute/early infection
References Wilson *et al.* 2000a

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load was also found.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWIILGGLNK.
- The subject with A*0201 had a moderately strong response to SLYNTVATL.
- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.
- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

Immunogen in vitro stimulation or selection
Species (MHC) human (A*0301)
Keywords epitope processing, dendritic cells
References Andrieu *et al.* 2003
- This study demonstrates that lipopeptides carrying epitopes can be taken up by human dendritic cells, processed using different pathways, and recognized by epitope-specific CD8+ T-cells originally derived from HIV+ individuals. The RT ILKEPVHGV peptide was embedded in a longer peptide fragment in the lipopeptide, and was internalized by endocytosis and processed in the cytosol by proteasomal cleavage by following an endosome-to-cytosol pathway for processing and presentation. Administration of epoxomycin, a proteasome inhibitor, completely abrogated epitope presentation to a CD8+ T-cell line, while monensin, an inhibitor of acid-dependent endosomal enzyme activity did not.
- In contrast to the RT epitope, dendritic cell presentation of the Nef epitope QVPLRPMTYK embedded in a longer peptide in a lipopeptide was not inhibited by epoxomycin, but was inhibited by monensin, indicative of endocytolitic epitope processing.

Country United Kingdom
Assay type CD8 T-cell Elispot - IFNγ, HLA binding
Keywords escape
References Milicic *et al.* 2005
- CTL responses and escape were analyzed in 4 homosexual couples where blood samples were available within weeks of estimated transmission. When the recipient had the same HLA type as the donor, CTL escape variants prevented a CTL response to those epitopes in the recipient. Even when the HLA alleles were different in the transmitting couple, a single escape mutation in one epitope can abolish CTL recognition of an overlapping epitope of distinct restriction in the recipient. In an early acute infection of the donor, the precise timing of transmission determines the viral variants transmitted.
- Two variants of this epitope, QVPvRPMTYK and QaPLRPMTYK, were found in 1 donor. The QaPLRPMTYK substitution reduced the binding affinity for A*0301 by 52%.

Epitope name QVP
Immunogen HIV-1 infection
Species (MHC) human (A*0301)
Assay type CD8 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords rate of progression, TCR usage, variant cross-recognition or cross-neutralization, characterizing CD8+ T cells
References Turnbull *et al.* 2006
- Functional cross-reactivity of CD8 responses to HIV-1 epitopes restricted by different HLA-alleles was analyzed. It was shown that epitope-specific responses with the most efficient cross-recognition were strongly associated with delayed disease progression. Variant-cross recognition efficiency was linked to the dominant TCRs used for epitope recognition. Epitopes restricted by the same HLA-allele did not show similar variant cross-recognition efficiency, suggesting that the rate of disease progression might be associated with the quality of responses to certain critical epitopes.
- This epitope, A3-QVP (that has no assoication with accelerated or delayed progression to AIDS) and its natural variants are less efficiently cross-recognized. Its alanine-substituted variants were inconsistent between individuals showing very efficient or poor cross-reactivity. CTLs responding to this epitope expressed the same predominant TCR Vbeta family, but individuals whose CTLs predominantly used TCR Vbeta 13.6 had poor cross-recognition of alanine substituted variants.

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag
Species (MHC) human, macaque (A*0301, A11)
Keywords subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance
References Hanke & McMichael 2000; Wee *et al.* 2002
- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Keywords assay standardization/improvement, immunodominance, optimal epitope
References Wang *et al.* 2007c

- HLA-A11-restricted CTL epitopes in 2 male Han Chinese subjects (one ART naive and one receiving HAART) were determined. A novel epitope was discovered and 5 other putative epitopes confirmed using 425 overlapping peptides spanning the entire HIV-1 clade B proteome. By employing intracellular cytokine staining, the authors developed a new method of mapping optimal epitopes and defining their HLA restriction efficiently. In spite of its being the most common HLA type in China, A*11-restricted epitopes were recognized less frequently than other epitopes, and A*11-restricted responses formed a mean of only 13% of the responses against HIV.
- This putative epitope, QVPLRPMTYK, was detected and confirmed within overlapping peptides EVGFPVRPQVPLRPMTYK and YKAAVDLSHFLKEKGGL. It was the immunodominant HLA-A*11 restricted epitope in 10 subjects tested.

- HLA-A*1101 has been associated with resistance to acquisition of HIV-1 infection in female sex-workers in Thailand. Its crystal structure has been determined in association with two immunodominant A*1101 HIV-1 CTL epitopes. Its anchor residues are confirmed as P2(Ile/Val) and C-term (Lys). The backbone conformation of the peptides is defined as two bulges separated by a secondary anchor residue (P6 Ser or Met) that may offer various advantages in the selection and presentation of CTL epitopes by HLA-A*1101.

Assay type CD8 T-cell Elispot - IFNγ
Keywords supertype, cross-presentation by different HLA
References Frahm *et al.* 2007b

- 100 HIV-infected subjects were tested for response to optimally-defined CTL epitopes regardless of the subject's HLA type. Half of all detected responses were seen in the absence of the originally reported restricting HLA class I allele, and only 3% of epitopes were recognized exclusively in the presence of their original allele. Statistical and experimental methods were used to define additional HLA alleles associated with the epitopes.
- Based on a prediction of the minimum number of HLA alleles needed to cover the HLA representation in all responders to this epitope, a minimum set of 6 alleles was found: 2 alleles previously known to be associated (A03, A11) and 4 additional alleles (A02, A33, B44, Cw07).
- In addition to its known HLA associations (A03, A11), an additional HLA (A34) was statistically predicted to be associated with this epitope.

Keywords HAART, ART, immunodominance, TCR usage, memory cells
References Weekes *et al.* 2006

- The effect of HAART on the population size, phenotype and function of HIV- and HCMV-specific CTL clones was analyzed. It was determined that the clonal composition of gag and env HIV-specific CD8 T-cells did not change after HAART. Following HAART, the size of immunodominant HIV-specific CD8 T-cell clones was found to diminish even with the relative preservation of functional memory responses. Maintainance of such strong functional responses implied the preferential loss of HIV-specific cells that have reduced cloning efficiency in vitro. HCMV-specific CTL clones had different kinetics and phenotypes than HIV-specific CTL clones in the same subject.

References Gray *et al.* 2009

- 47 HIV-1 subtype C infected patients were followed longitudinally to determine whether there was a relation between magnitude and breadth of CTL responses in primary, acute infection (measured by IFN-gamma ELISpot) and disease progression (measured as viral load at 12 months). CTL responses to Nef were dominant (targeting 6 epitopic regions), followed by responses to Gag, Pol, Rev, Vpr, Env, Vpu, Vif and finally Tat.
- QVPLRPMTYK is a known HLA-A3 and -A11 epitope that is part of peptide EVGFPVRPQVPLRPMTYKA which elicited responses in 3/9 patients. HLA-A*0301-restricted response to a peptide containing this epitope was detected in an early controller and 2 rapid progressors 12 weeks post-infection.

Assay type CD8 T-cell Elispot - IFNγ
Keywords binding affinity, acute/early infection, early-expressed proteins
References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Assay type CD8 T-cell Elispot - IFNγ, HLA binding
Keywords HAART, ART, escape, viral fitness and reversion
References Asquith *et al.* 2006

- In order to reconcile apparent conflicts between a CTL-protective role as suggested by HLA-1 alleles associated with different rates of progression to AIDS, and a CTL non-protective role as suggested by the fact that virus clearance following ART is not impaired in advanced AIDS, a model is made that quantifies the efficiency of HIV-1-specific CTLs in vivo. As a surrogate for the actual rate of CTL-killing of infected cells, the model rests on calculating virus escape rate for an epitope and subtracting its reversion rate upon transmission to a non-restricting HLA bearing host. It is shown that CTLs recognizing a single epitope kill only 2% of productively infected CD4+ cells. The rate of CTL lysis was found to be significantly faster during primary infection than in chronic infection. However, the authors suggest that small differences in CTL lysis rate can translate into large differences in terms of absolute numbers of infected cells killed, which are likely to be clinically relevant.
- The best estimates of escape rate for this epitope, QVPLRRMTYK, were found to be 0.022 and 0.003/day (upper bound on rate of escape = 0.05 and 0.011), with SEs of 0.013 and 0.003 respectively, in 2 subjects.
- In the first subject, a number of mutations arose in Nef 73-82; all but one of these (V74A) elicited a very weak ELISpot response compared to the wild type. In the second subject, large epitope deletions and a V74I substitution in the recognized epitope were selected for.

Assay type proliferation, CD8 T-cell Elispot - IFNγ, Tetramer binding
Keywords immunodominance, acute/early infection, characterizing CD8+ T cells, immune dysfunction
References Lichterfeld *et al.* 2004a

- HIV-1 specific CD8+ T-cells in acute and long-term nonprogressive HIV-1 infection show strong ex-vivo proliferative capacities which are rapidly lost in chronic HIV-1 infection. The loss of CD8+ T-cell function is closely linked with the loss of HIV-1 specific, IL2 secreting CD4+ T-cells. The function can be rescued in vitro and in vivo by restoring the specific CD4+ T-cell help.
- Full CD8+ T-cell responses to this epitope were dependent on co-stimulation with a CD4+ T cell dependent epitope from T-cells harvested during acute infection. The CD8+ T-cell response to this epitope was immunodominant in one study individual.

Country United States
Assay type CD8 T-cell Elispot - IFNγ
Keywords HAART, ART, mother-to-infant transmission, rate of progression, co-receptor, immune evasion, HLA associated polymorphism
References Reinis *et al.* 2007

- HIV-1 mother-to-child transmission is studied for LTNPs by comparing entire genomes from 2 mother (M1, M2) and 2 daughter (D1, D2) RNA samples of a mother-child pair over 11 years. Genetic distance was 94% between subjects' strains. Divergence in sequences was attributed to distinct HLA selection pressures as ds/dn was larger for intra- rather than inter-person sequences. 10 new mutations in D2 were found related to unique daughter HLA alleles.
- Functional ELISpot studies using D2 and Nef peptides reveal strong associations between CTL responses and escape variants, contributing to delayed progression.
- LTNP status was not related to defective virus since all viral genes were intact and CTL response did not effectively control viral load. It is supposed that genetic HLA background and HIV-1 epitope-immune response interaction account for nonprogression of disease.
- All isolates contained R77Q in Vpr, a variation associated with reduction of cellular apoptosis.
- This Nef overlapping peptide, QVPLRPMTYKAAVDL was mutated in the daughter D2 isolate to QVPLRPMTfKAAVDL.

CTL CD8+

Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords binding affinity, immunodominance
References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, QVPLRPMTYKAAVDLSHF, had an overall frequency of recognition of 34% - 40.7% AA, 38.5% C, 29.5% H, 19% WI. This peptide is included in a 58 aa Nef highly reactive region to be used for vaccine design. It is also part of 'Region I', EVGFPVRPQVPLRPMTYKAAVDLSHFLKEKGGLEGLIYSQK, a 41 aa region recognized by >90% of subjects across ethnic groups.

Keywords HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-B*35-associated substitution within optimally defined epitope VPLRPMTY is at position Y8, VPLRPMTy.

Keywords subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance
References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Assay type CD8 T-cell Elispot - IFNγ, CD4 T-cell Elispot - IFNγ
Keywords rate of progression, immunodominance, escape
References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses,and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0-80% as efficiently as the index peptide, and the relatively efficiency of the variant eptiopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- VPL epitope was one of six that were largely or completely replaced by escape variants, with the two escape forms coming up between days 172 and 635, vplrpmSy and vplrmptF.

Assay type CD8 T-cell Elispot - IFNγ
Keywords computational epitope prediction, vaccine-induced epitopes
References Li *et al.* 2006b

- To assess the efficiency of vacine-elicited T-cell responses to epitopes in circulating strains of HIV-1 rather than to consensus or ancestor epitope sequences, the authors used potential T-cell epitopes (PTEs) from Gag, Pol, Nef and Env proteins, to construct an epitope prediction model for peptide selection. Evaluation in their method was conducted by testing Nef-specific CTL responses in four HIV-1 subtype B infected subjects. It was found that peptides autologous to HIV-1 immunogen sequence were the best for vaccine design and that vaccine response evaluation was better performed using peptide sets from circulating strains of HIV-1.
- This epitope, IPLRPMTYKgAlDLS, varies from the consensus peptide at positions 10 and 12.

Species (MHC) human (B*07)
Country Australia, Canada, Germany, United States
Keywords escape, HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-B*07-associated substitutions within optimally defined epitope RPMTYKAAL are at positions T4, Y5 and L9, RPMtyKAAl. RL9 has very low recognition frequency and escape.

Keywords binding affinity, epitope processing
References Choppin *et al.* 2001

- Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The strength of HLA-peptide binding was not directly related to the number of individuals that recognized a protein.
- 20s proteasome cleavage of the Nef protein positions 66-100 showed a large fraction of peptides were cleaved ending at: 87L, 83A, 81Y, 71P, 68F and 67G. The frequency of recognition may be in part dictated by the cleavage step in processing.
- RPMTYKAAV was recognized in 7/10 (70%) of individuals with HLA B7, and 0/3 (0%) of individuals with HLA B35. It was a moderate affinity HLA binder.

Keywords rate of progression, immunodominance, escape
References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses,and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0-80% as efficiently as the index peptide, and the relatively efficiency of the variant eptiopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This epitope was one of six epitopes found to be under positive selection for escape mutations and was completely replaced by escape variants between days 172 and 635 (rpmtFkgal, rpmSykAal, rpmtykgaV, rpmtykAal). The first two were the most common at day 635, and experimentally shown to be escape.

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Assay type CD8 T-cell Elispot - IFNγ
Keywords HAART, ART, mother-to-infant transmission, rate of progression, co-receptor, immune evasion, HLA associated polymorphism
References Reinis *et al.* 2007

- HIV-1 mother-to-child transmission is studied for LTNPs by comparing entire genomes from 2 mother (M1, M2) and 2 daughter (D1, D2) RNA samples of a mother-child pair over 11 years. Genetic distance was 94% between subjects' strains. Divergence in sequences was attributed to distinct HLA selection pressures as ds/dn was larger for intra- rather than interperson sequences. 10 new mutations in D2 were found related to unique daughter HLA alleles.
- Functional ELISpot studies using D2 and Nef peptides reveal strong associations between CTL responses and escape variants, contributing to delayed progression.
- LTNP status was not related to defective virus since all viral genes were intact and CTL response did not effectively control viral load. It is supposed that genetic HLA background and HIV-1 epitope-immune response interaction account for nonprogression of disease.
- All isolates contained R77Q in Vpr, a variation associated with reduction of cellular apoptosis.
- This Nef overlapping peptide, RPMTYKAAVDLSHFL was mutated in the daughter D2 isolate to RPMTfKAAVDLSHFL.

Epitope name AK9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A3)
Donor MHC A24, A3, B7
Country United States
Assay type CD8 T-cell Elispot - IFNγ
Keywords computational epitope prediction, vaccine-induced epitopes
References Li *et al.* 2006b

- To assess the efficiency of vacine-elicited T-cell responses to epitopes in circulating strains of HIV-1 rather than to consensus or ancestor epitope sequences, the authors used potential T-cell epitopes (PTEs) from Gag, Pol, Nef and Env proteins, to construct an epitope prediction model for peptide selection. Evaluation in their method was conducted by testing Nef-specific CTL responses in four HIV-1 subtype B infected subjects. It was found that peptides autologous to HIV-1 immunogen sequence were the best for vaccine design and that vaccine response evaluation was better performed using peptide sets from circulating strains of HIV-1.

Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 47% of the study subjects, and it was the most frequently recognized peptide.

Assay type CD8 T-cell Elispot - IFNγ, Other
References Balamurugan *et al.* 2008

- To check whether unsuccessful vaccines may interfere with normal patient immune response,2 subjects were followed. The first, 00015, was seronegative while receiving vaccination, but later contracted infection. The second, 00016, had temporary sexual contact with subject 00015 and showed symptoms of disease 2 weeks before him. Without treatment, both reached low chronic viremic levels, and showed similar magnitude of immune response.
- Similar immune pressure was seen on viral sequences in both patients, over time in Gag, Pol, Nef.
- Data suggest that the vaccine failed to prime subject 00015 against HIV infection, but it did not impair ability to naturally contain viremia in comparison with infecting subject 00016.
- CTL immune response to consensus sequence YKGALDLSHFL was elicited in subject 00015. Consensus epitope of both subjects was YKGAvDLSHFL.

Epitope `YKAAVDLSHFLKEKG`
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Bailey *et al.* 2008

- This is the first documentation of transmission of HIV-1 from a patient who developed AIDS (Progressor) to an Elite Suppresssor (ES).
- Both patients are HLA-B*5703-positive. The ES also has B*27 allele. Escape mutations in HLA-B*57-restricted epitopes were present in both patients, suggesting that they by themselves cannot explain the difference in the outcomes.
- The study concluded that viral replication is controlled in ES by at least two mechanisms: (i) direct inhibition of viral replication by polyfunctional HIV-1 specific CD8+ T cells that proliferate in response to autologous viral peptides; (ii) selection for and maintenance of escape mutations that have a negative impact on viral fitness.
- This epitope elicited IFN-γ response in the ES. Both the ES and the Progressor had A83G, V85L substitutions.

Country China
Assay type CD8 T-cell Elispot - IFNγ
Keywords subtype comparisons, immunodominance
References Zhao *et al.* 2007

- 46 ART-naive subjects with HIV-B infection were used to study CTL cross-responses between HIV clade B and C peptide sequences. 204/826 overlapping peptide epitopes tested were common between both clades in eliciting CTL responses that were of similar magnitude and frequency in both HIV-B and -C. Higher magnitudes and frequencies of responses were detected with peptides from Gag, Pol, Env and Nef proteins, while peptides from Rev, Vif, Vpu, Vpr and Tat were recognized less often.
- 27 peptides from immunodominant regions of higher interclade homology in Gag, Nef, Pol, Vpr, Env and Vif were found to be common between both clades in eliciting the greatest CTL responses. Although these 27 peptides differed by up to 39% between clades, CTL responsiveness was not affected.
- Cross-recognized peptides had a lower entropy of recognition than clade-B specific variants, suggesting that published conserved clade-B sequences are also more conserved between clades. Consensus sequences therefore occurred in virus regions of low intra-clade entropy and high inter-clade homology.
- 18/27 highly immunogenic clusters were previously reported by Frahm et al. [J. Virol. 78:2187-2200 (2004)].
- This peptide, yKGAlDLShFLKEKGGL differs from the consensus C sequence fKGAfDLSfFLKEKGGL at 3 amino acid positions, i.e. by 17.6%.

Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords binding affinity, immunodominance
References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, YKAAVDLSHFLKEKGGL, had an overall frequency of recognition of 30% - 33.9% AA, 30.8% C, 31.8% H,

14.3% WI. This peptide is included in a 58 aa Nef highly reactive region to be used for vaccine design. It is also part of 'Region I', EVGFPVRPQVPLRPMTYKAAVDLSH-FLKEKGGLEGLIYSQK, a 41 aa region recognized by >90% of subjects across ethnic groups.

Country Botswana, Ethiopia, Tanzania, South Africa
Assay type CD8 T-cell Elispot - IFNγ
Keywords escape, HLA associated polymorphism
References Bhattacharya *et al.* 2007

- Host HLA associated mutational patterns in HIV can be a consequence of immune escape, but to cleanly resolve whether or not such patterns are the result of lineage effects or immune pressure, it is helpful to incorporate the phylogenetic history of the virus into the test statistics. Most of the HLA associations that appeared to result from immune escape in an earlier study (Moore et al., Science 296:1439 2002) were found to be a consequence of the phylogenetic history of the virus, not immune escape. Other HLA associations were validated, and some additional HLA-associated mutations were identified through incorporating the viral phylogenetic tree in the analysis.
- There are two variant forms of this B57/B5801 epitope at the second position KaAFDLSFF and KgAFDLSFF. Leslie et al., J Exp Med. 2005 201:891 suggest that the escape form KgAFDLSFF may have come to dominate the C clade lineage over time due to higher HLA B57/B5801 frequencies in southern Africa. Bhattacharya suggests lineage effects are also playing an important role in the observed amino acid frequencies, and note that the ratio of G/A has not change over time, and that the frequency of G/A in different epidemic populations does not correlate with HLA B57/B5801 allele frequency.

Epitope KAAVDLSHFL
Immunogen HIV-1 infection
Species (MHC) human (Cw08)
Country United States
Assay type CD8 T-cell Elispot - IFNγ
Keywords supertype, cross-presentation by different HLA
References Frahm *et al.* 2007b

- 100 HIV-infected subjects were tested for response to optimally-defined CTL epitopes regardless of the subject's HLA type. Half of all detected responses were seen in the absence of the originally reported restricting HLA class I allele, and only 3% of epitopes were recognized exclusively in the presence of their original allele. Statistical and experimental methods were used to define additional HLA alleles associated with the epitopes.
- In addition to its known HLA association (Cw08), an additional HLA (Cw03) was statistically predicted to be associated with this epitope.

Country United States
Assay type Intracellular cytokine staining, Other
Keywords rate of progression, escape, immune evasion
References Karlsson *et al.* 2007

- To correlate evolving HIV-1 populations with HLA-A2 restricted immune responses for epitopes in Gag, Pol, Env and Nef, 11 treatment-naive subjects were longitudinally studied. Results show that increased viral load is often associated with broad CTL responses early in infection that persist as an "immunological footprint". Conversely, early, restricted responses may help limit viral load. Phylogenetic and functional evidence of viral escape is seen in Gag, Nef and Pol. Gag and Nef show flanking epitope changes restricted by non-HLA-A2 alleles. As far as modes of viral adaptation, CTL responses were seen to develop both against static viral populations resulting in viral evolution to HLA-A2 as well as against existing mutants resulting in reselection of consensus B-like variants. This study reinforces that CTL immune responses detected are not necessarily beneficial to patients, but may be "footprints" from early effective responses that the virus has since escaped.
- The AL9 epitope AAVDLSHFL elicited a potent CTL response while its minor variant AAVDiSHFL containing substitution L87I at position 5 elicited a less intense response, resulting in the L87I variant later dominating the viral population. This is a novel viral adaptation to an HLA-A2 restricted immune response discovered in Nef epitope AL9. In later longitudinal studies, more variants were seen either linked - AAVDirHFL - or not linked with the L87I mutant. Two new mutants seen were the A83G at position 1, gAlDLSHFL and gArDLSHFL; and the V85L at position 3, AAlDLSHFL, AAlDiSHFL, AAlDiSHlL. Amino acid positions 83, 85, 97 and 91 were under positive selection pressure.
- Responses to AL9 were seen in early chronic infection.

Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding
Keywords memory cells
References Wherry *et al.* 2006

- Cohorts of HIV-infected subjects from the US and South Africa were screened for CD8+ EliSpot responses. Tetramer assays were performed for 13 frequently targeted HIV epitopes and compared to Flu, vaccinia, and EBV epitopes assayed in non-HIV-infected subjects. HIV tetramer+ CD8 T cells expressed less CD127, and this reduction was pervasive across all epitopes and alleles tested. These results indicated impaired HIV-specific memory CD8 T cell differentiation, regardless of level of control of viremia, epitopes targeted, or HLA alleles.

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- Four different individuals recognized this epitope during a primary infection, and it was shown to be presented by HLA B60, B62, C2*0802, and Cw8.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

References Malhotra *et al.* 2007a

- The ability of T cells from early infected subjects to recognize Nef clade B HIV-1 epitope variants was tested using both a consensus peptide panel and a standardized potential T-cell epitope panel (PTE-B). The magnitude and breadth of PTE-optimized peptide panels was significantly higher than CON peptides'. 29 potential epitopic domains were detected in Nef using the PTE peptide set.
- 5 additional variants of this epitope, AAVDLSHFL, were seen - gAVDLSHFL, AAiDLSHFL, AAlDLSHFL, gAlDLSHFL and gAfDLSHFL. The last 3 variants show lower avidity than responses to the consensus epitope do.
- HLA-restriction to epitope AL9 in two different subjects were -B62 and -Cw08.

Epitope AAVDLSHFL
Epitope name AL9
Immunogen HIV-1 infection
Species (MHC) human (Cw*03)
Assay type CTL suppression of replication
Keywords class I down-regulation by Nef
References Adnan *et al.* 2006

- The impact of Nef on antiviral activity was studied. CTL-targeting epitopes were susceptible to the effects of Nef, both in late (Gag, RT, Env) and in early proteins (Rev, Nef), although to a lesser degree in early proteins. HLA-C-restricted CTLs (unlike HLA-A and HLA-B) were unaffected by Nef both in early (Nef) and late (Env) proteins.
- Nef epitope AAVDLSHFL-recognizing HLA-C restricted CTLs were unaffected by Nef.

References Draenert *et al.* 2006

CTL CD8+

- HIV-specific cellular and humoral immune responses were examined in monozygotic male twins infected simultaneously with the same virus. 15 of 17 targeted epitopes were identical in the twins, including two immunodominant responses. 3 of 4 declining responses in the twins showed mutations at the same residue. Evolving antibody responses cross-neutralized the other twin's virus. The results were compared with a third brother, infected by the twins' virus 13 months after their seroconversion. The data show similarity in disease course in persons of identical genetic background infected with the same strain of HIV-1.
- This epitope, AALDMSHFL (AL9), is restricted by HLA-Cw3. Variants that arose were AALDiSHFL and gALDMSHFL.

Assay type CD8 T-cell Elispot - IFNγ
Keywords acute/early infection, early treatment
References Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.

Assay type CD8 T-cell Elispot - IFNγ
Keywords computational epitope prediction, vaccine-induced epitopes
References Li *et al.* 2006b

- To assess the efficiency of vacine-elicited T-cell responses to epitopes in circulating strains of HIV-1 rather than to consensus or ancestor epitope sequences, the authors used potential T-cell epitopes (PTEs) from Gag, Pol, Nef and Env proteins, to construct an epitope prediction model for peptide selection. Evaluation in their method was conducted by testing Nef-specific CTL responses in four HIV-1 subtype B infected subjects. It was found that peptides autologous to HIV-1 immunogen sequence were the best for vaccine design and that vaccine response evaluation was better performed using peptide sets from circulating strains of HIV-1.
- This peptide GAlDLSHFLKEKGGL varies at position 3 (leucine)from the consensus peptide YKAAVDLSHFLKEKG .

- HLA-A11-restricted CTL epitopes in 2 male Han Chinese subjects (one ART naive and one receiving HAART) were determined. A novel epitope was discovered and 5 other putative epitopes confirmed using 425 overlapping peptides spanning the entire HIV-1 clade B proteome. By employing intracellular cytokine staining, the authors developed a new method of mapping optimal epitopes and defining their HLA restriction efficiently. In spite of its being the most common HLA type in China, A*11-restricted epitopes were recognized less frequently than other epitopes, and A*11-restricted responses formed a mean of only 13% of the responses against HIV.
- This putative epitope, AVDLSHFLK, was detected and confirmed within overlapping peptides SHFLKEKGGLEGLIYSQK and YKAAVDLSHFLKEKGGL.

References Fukada *et al.* 2002

- Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A-E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals.
- AVDLSHFLK was found to elicit clade-specific responses in clade B (AVDLSHFLK is most common, aLdlshflk is a common variant also found in clade A) and clade E (aFdlsFflk is most common and is also common in clade C). AVDLSHFLK was strongly recognized by CTL from 2/5 B clade infected Japanese subjects, as was aLdlshflk, and aFdlsFflk by CTL from 5/7 E clade infected Thai subjects.
- The binding of aFdlsFflk to HLA A*1101 was 10-50 times lower than the other variants, and bulk CTL generated from individuals did not cross-react with the cross-clade peptides.

Keywords HAART, ART, supervised treatment interruptions (STI)
References Oxenius *et al.* 2002b

- Using previously defined epitopes Oxenius *et al.* [2000, 2001a] in an IFNgamma Elispot assay, 13 chronically HIV-1 infected patients were studied over a period including therapy with standard treatment interruptions (STI).
- STIs induced increased recognition of CTL epitopes, but there was no correlation between CTL responses with viral rebound rates, plateau viral loads, or clearance rates.

HXB2 Location Nef (84–92)
Author Location Nef
Epitope AVDLSHFLK
Subtype A, B, D, F
Immunogen HIV-1 infection, vaccine
Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag
Species (MHC) human, macaque (A11)
Keywords subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance
References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Epitope AVDLSHFLK
Epitope name AK9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A11)
Donor MHC A11, A2, B18, B44, Cw12, Cw5
Country United States
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining, Flow cytometric T-cell cytokine assay
Keywords optimal epitope
References Allen *et al.* 2005b

- 4/14 optimal HIV-1 T-cell epitopes in a subject underwent mutation associated with dramatic loss of the original CD8 response. For 1 of the escape variants, a novel CD8 T-cell response equal in magnitude to the wildtype, was generated. CD8 T-cell recognizing the variant epitope utilized a distinct T-cell receptor and did not exhibit any cross-reactivity against the wildtype.
- This epitope did not vary.

Epitope `AVDLSHFLK`
Epitope name A11-AK9(Nef)
Immunogen HIV-1 infection
Species (MHC) human (A11)
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, immunodominance, early-expressed proteins
References Altfeld *et al.* 2006

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognized epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.

Epitope name AL9, ALK9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A11, Cw8)
Country United States
Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding, Flow cytometric T-cell cytokine assay
Keywords characterizing CD8+ T cells
References Streeck *et al.* 2008a

- T-cells were studied for exhaustion and dysfunction in chronic HIV infection. Polyfunctionality of CTL immune response to HIV-1 decreased with persistence of antigen presence over time in chronic infection. CTL exhaustion can thus be halted by reduction in viral antigen load - either by ART or through escape mutations.
- PD-1, marker for activation and apoptosis increases over time, but it decreases when epitope mutations develop. CD127, a marker whose down-modulation indicates lack of memory T cell formation, however, is not impacted by viral escape. Both markers are linked to CTL functional exhaustion.

- 409 days after first testing, epitope AVDLSHFLK showed no variation in an untreated patient. 511 days after first testing, an untreated patient's epitope, AAVDLSHFL, varied to AAfDLSyFL and AAlDLSyFL. Previously published HLA-restriction for AL9 is HLA-A11, -Cw8.

HXB2 Location Nef (84–92)

Epitope AVDLSHFLK
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A3)
Keywords binding affinity, epitope processing
References Choppin *et al.* 2001

- Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The strength of HLA-peptide binding was not directly related to the number of individuals that recognized a protein.
- 20s proteasome cleavage of the Nef protein positions 66-100 showed a large fraction of peptides were cleaved ending at: 87L, 83A, 81Y, 71P, 68F and 67G. The frequency of recognition may be in part dictated by the cleavage step in processing.
- AVDLSHFLK was recognized in 4/12 (33%) of individuals with HLA A3. It was a high affinity HLA-A3 binder.

Country United States
Assay type CD8 T-cell Elispot - IFNγ
Keywords responses in children, mother-to-infant transmission, escape, characterizing CD8+ T cells, viral fitness and reversion
References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness.
- Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- Variant sequence aMdlshflk was present in 7/10 clones from A3+ mother, was transmitted and present in 10/10 clones at months 2 and 4, but dropped to 0/10 clones by 15 months of age in her A3- child.

- 46 ART-naive subjects with HIV-B infection were used to study CTL cross-responses between HIV clade B and C peptide sequences. 204/826 overlapping peptide epitopes tested were common between both clades in eliciting CTL responses that were of similar magnitude and frequency in both HIV-B and -C. Higher magnitudes and frequencies of responses were detected with peptides from Gag, Pol, Env and Nef proteins, while peptides from Rev, Vif, Vpu, Vpr and Tat were recognized less often.
- 27 peptides from immunodominant regions of higher interclade homology in Gag, Nef, Pol, Vpr, Env and Vif were found to be common between both clades in eliciting the greatest CTL responses. Although these 27 peptides differed by up to 39% between clades, CTL responsiveness was not affected.
- Cross-recognized peptides had a lower entropy of recognition than clade-B specific variants, suggesting that published conserved clade-B sequences are also more conserved between clades. Consensus sequences therefore occurred in virus regions of low intra-clade entropy and high inter-clade homology.
- 18/27 highly immunogenic clusters were previously reported by Frahm et al. [J. Virol. 78:2187-2200 (2004)].
- This peptide, ShFLKEKGGLEGLIYSqK differs from the consensus C sequence SfFLKEKGGLEGLIYSkK at 2 amino acid positions, i.e. by 11.1%.

References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.

CTL CD8+

- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, SHFLKEKGGLEGLIYSQK, had an overall frequency of recognition of 18% - 20.3% AA, 30.8% C, 15.9% H, 0% WI. This peptide is included in a 58 aa Nef highly reactive region to be used for vaccine design. It is also part of 'Region I', EVGFPVRPQVPLRPMTYKAAVDLSHFLKEKGGLEGLIYSQK, a 41 aa region recognized by >90% of subjects across ethnic groups.

- Maturation phenotypes of CTLs were compared between HIV-1 Controller and Progressor subjects. Controllers were found to recognize a median of 18 epitopes compared to 15 by Progressors. While Controllers certainly had higher frequencies of terminally differentiated effector CTLs (CD45RA+/CCR7-), Progressors had higher mean frequencies of CD45RA-/CCR7- effector memory, CD45RA-/CCR7+ central memory (statistically significant) and CD45RA+/CCR7+ naive CTLs. No correlation was seen between CTL effector phenotype and either HLA-type or epitope.
- B*08-restricted epitope FLKEKGGL does not correlate with any particular CTL maturation phenotype.

Keywords escape, HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-B*08-associated substitutions within optimally defined epitope FLKEKGGL are at positions L2, E4 and K5, FlKekGGL. FL8 has a high (>70%) recognition frequency and robust escape rate.

- In 4 donors with delayed disease progression, the response to the FL8 Nef epitope was dominated by V-beta-13.2 TCR expressing CTLs with an unusually long CDR3 region. These CTLs were shown to be resistant to apoptosis and able to recognize escape variants of the FL8 Nef epitope. Thus, selection of these CTLs may be related to better clinical outcome.
- The Q5 variant flkeQggl was rapidly selected in a donor that responded to the FLKEKGGL epitope. The FLKEKGGL peptide and the variant flkeQggl HLA-B8 complexes bound to the Vbeta13.2 FLKEKGGL TCR with equal affinity, while the Vbeta6 FLKEKGGL TCR had reduced affinity for the FLKEKGGL form and did not recognize the Q5 variant. Other variants (T5, N5, and M5 as well as Q5) were recognized by Vbeta13.2 clones from all 4 donors. One clone from donor 046 that was not Vbeta13.2 could only recognize the index variant.

CTL CD8+

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

- CTL responses and escape were analyzed in 4 homosexual couples where blood samples were available within weeks of estimated transmission. When the recipient had the same HLA type as the donor, CTL escape variants prevented a CTL response to those epitopes in the recipient. Even when the HLA alleles were different in the transmitting couple, a single escape mutation in one epitope can abolish CTL recognition of an overlapping epitope of distinct restriction in the recipient. In an early acute infection of the donor, the precise timing of transmission determines the viral variants transmitted.
- The recipient mounted an acute CTL response to this epitope, and the escape variant flkeQggl emerged soon after.

Keywords rate of progression, TCR usage, variant cross-recognition or cross-neutralization, characterizing CD8+ T cells
References Turnbull *et al.* 2006

- Functional cross-reactivity of CD8 responses to HIV-1 epitopes restricted by different HLA-alleles was analyzed. It was shown that epitope-specific responses with the most efficient cross-recognition were strongly associated with delayed disease progression. Variant-cross recognition efficiency was linked to the dominant TCRs used for epitope recognition. Epitopes restricted by the same HLA-allele did not show similar variant cross-recognition efficiency, suggesting that the rate of disease progression might be associated with the quality of responses to certain critical epitopes.

- This epitope, B8-FLK that is associated with more rapid progression to AIDS and its natural as well as alanine-substituted variants were quite weakly cross-recognized. CTLs responding to this epitope expressed the same predominant TCR Vbeta family.

References Alter *et al.* 2008

- By studying HIV-1 dysregulation of CTLs at different infection stages induced by inhibitory KIRs (Killer Immunoglobulin-like receptors), it was determined that KIR surface expression on memory T cells correlates with HIV replication. It results in reduced activation, proliferation, cytokine secretion, and killing following TCR stimulation. Since non-TCR-dependent CTL stimulation was unaffected, TCR-mediated stimulation appears to be defective. KIR induced suppression of CTL function was found to be KIR-ligand-independent.
- FL8-specific CTLs had heterogeneous surface expression of KIR. Of these tetramer positive B08-CTLs, only KIR- cells were able to secrete IFN-gamma upon stimulation.

References Altfeld *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-B8+ individuals that had a CTL response to this epitope broken down by group: 3/3 group 1, 1/3 group 2, and 1/2 group 3.

- Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The strength of HLA-peptide binding was not directly related to the number of individuals that recognized a protein.
- 20s proteasome cleavage of the Nef protein positions 66-100 showed a large fraction of peptides were cleaved ending at: 87L, 83A, 81Y, 71P, 68F and 67G. The frequency of recognition may be in part dictated by the cleavage step in processing.
- FLKEKGGL was recognized in 12/14 (86%) of individuals with HLA B8, and it was a high affinity HLA binder.

Immunogen HIV-1 infection, vaccine
Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag
Species (MHC) human, macaque (B8)
Keywords subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance
References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Keywords binding affinity, acute/early infection, early-expressed proteins
References Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

Keywords HAART, ART, memory cells, immune dysfunction
References Gamberg *et al.* 2004a

- HAART restores HIV specific immunity after advanced infection by increase of CD4+ and CD8+ T cell numbers after supression of viral replication. However, HIV specific CTLs emerged only with detectable viral replication breakthroughs and were short-lived while CD4+ T-cell responses remained compromised, suggesting failure of generating stable CD8+ memory T-cells in the absence of HIV-specific T-helper responses.

HXB2 Location Nef (90–97)
Author Location Nef
Epitope FLKEKGGL
Subtype B
Immunogen HIV-1 infection
Species (MHC) (B8)
Keywords binding affinity, review, escape, characterizing CD8+ T cells
References da Silva 2003

- Evidence of the evolutionary adaptation of HIV-1 to the specific neutralizing antibody response and CTL detection is reviewed. Both SIV and HIV epitopes are discussed, with a detailed summary of one patient's response and CTL escape in the FLKEKGGL epitope. The three C-terminal amino acids were left unchanged, and it may be due to high fitness costs as these are putatively invloved in CD4 down-regulation and formation of a hydrophobic pocket in Nef. The N terminal residue is involved in binding to protein tyrosine kinases.
- Immediately after infection the susceptible eptiope FLKEKGGL was found in 20/20 viral sequences. Six months later, it was only found in 4/44 sequences. The flkeNggL form was most common, 24/44 cases; it bound poorly to HLA B08 and was poorly recognized by CTL. Two minor variants were found 3/44 times, flkeEggl and flkeQggl; both bound poorly to B08, but the K->Q substitution was still well recognized. A variant flkDkggl was found in 4/44 sequences; it bound B08 moderately well, but was poorly recognized. 3 double mutants were found once each, and were not recognized by CTL: fIkeNggL, flEeNggL, and flkGNggL.

References Lichterfeld *et al.* 2004a

- HIV-1 specific CD8+ T-cells in acute and long-term nonprogressive HIV-1 infection show strong ex-vivo proliferative capacities which are rapidly lost in chronic HIV-1 infection. The loss of CD8+ T-cell function is closely linked with the loss of HIV-1 specific, IL2 secreting CD4+ T-cells. The function can be rescued in vitro and in vivo by restoring the specific CD4+ T-cell help.
- Full CD8+ T-cell responses to this epitope were dependent on co-stimulation with a CD4+ T cell dependent epitope from T-cells harvested during acute infection. The CD8+ T-cell response to this epitope was immunodominant in one study individual.

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.
- A Nef epitope FLKEeGGL (Nef-94E) presumed escape variant was transmitted from a B8 positive donor to a B8 negative recipient. FLKEgGGL, FLKgeGGL variants as well as FLKEkGGL reversions were found in the recipient subject.

Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding
Keywords memory cells
References Wherry *et al.* 2006

- Cohorts of HIV-infected subjects from the US and South Africa were screened for CD8+ EliSpot responses. Tetramer assays were performed for 13 frequently targeted HIV epitopes and compared to Flu, vaccinia, and EBV epitopes assayed in non-HIV-infected subjects. HIV tetramer+ CD8 T cells expressed less CD127, and this reduction was pervasive across all epitopes and alleles tested. These results indicated impaired HIV-specific memory CD8 T cell differentiation, regardless of level of control of viremia, epitopes targeted, or HLA alleles.

- T-cells were studied for exhaustion and dysfunction in chronic HIV infection. Polyfunctionality of CTL immune response to HIV-1 decreased with persistence of antigen presence over time in chronic infection. CTL exhaustion can thus be halted by reduction in viral antigen load - either by ART or through escape mutations.
- PD-1, marker for activation and apoptosis increases over time, but it decreases when epitope mutations develop. CD127 however, is not impacted by viral escape.
- 163 days after first testing, this epitope, FLKEKGGL, went from dual- and triple-functional to monofunctional in the response it was able to elicit.
- Epitope FLKEKGGL showed no variation in a treated patient. 163 and 364 days after first testing, epitope FLKEKGGL showed no variations in untreated patients; 409 days after first testing, epitope FLKEKGGL showed variations in untreated patients to FLrKEGGL, and to FLKEqGGL. Previously published HLA-restriction for FL8 is HLA-B8.

- In order to reconcile apparent conflicts between a CTL-protective role as suggested by HLA-1 alleles associated with different rates of progression to AIDS, and a CTL non-protective role as suggested by the fact that virus clearance following ART is not impaired in advanced AIDS, a model is made that quantifies the efficiency of HIV-1-specific CTLs in vivo. As a surrogate for the actual rate of CTL-killing of infected cells, the model rests on calculating virus escape rate for an epitope and subtracting its reversion rate upon transmission to a non-restricting HLA bearing host. It is shown that CTLs recognizing a single epitope kill only 2% of productively infected CD4+ cells. The rate of CTL lysis was found to be significantly faster during primary infection than in chronic infection. However, the authors suggest that small differences in CTL lysis rate can translate into large differences in terms of absolute numbers of infected cells killed, which are likely to be clinically relevant.
- The best estimate of escape rate for this epitope, FLKEKGGL, was found to be 0.049/day, with SE of 0.012.
- In the subject studied, a number of variants arose in the Nef epitope 90-97 (including complete epitope deletion) that were poorly recognized by CTL or escaped recognition completely.

- Differences in early versus chronic AIDS include a decline in CTL number accompanied by a reducing viremia. Comparative analysis of such CTLs in this study show that early infection is characterized by a different clonotypic composition and higher functional avidity of CTLs followed by their selective depletion during transition to chronic disease. The total magnitude of CTL cytokine production is lower in early infection. Intraindividual, early CTLs' functional avidity for the same epitope decreases concomitantly with a reduction in clonotypic TCR repertoire especially of strongly activated and

CD127lo, CD38+, Ki-67hi CTLs while progressing to chronic infection states.
- None of the target epitopes, including this epitope FLKEKGGL seen in 4 patients, underwent sequence changes.

- Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The strength of HLA-peptide binding was not directly related to the number of individuals that recognized a protein.
- 20s proteasome cleavage of the Nef protein positions 66-100 showed a large fraction of peptides were cleaved ending at: 87L, 83A, 81Y, 71P, 68F and 67G. The frequency of recognition may be in part dictated by the cleavage step in processing.
- FLKEKGGLEGL was recognized in 8/12 (67%) of individuals with HLA A2. It was a low affinity HLA A2 binder.

Epitope FLKEKGGLEGLIHSQ
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Assay type T-cell Elispot
Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003
- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Epitope KEKGGLEGL
Epitope name KL9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B*40)
Country United States
Assay type Intracellular cytokine staining, Other
Keywords rate of progression, escape, immune evasion
References Karlsson *et al.* 2007
- To correlate evolving HIV-1 populations with HLA-A2 restricted immune responses for epitopes in Gag, Pol, Env and Nef, 11 treatment-naive subjects were longitudinally studied. Results show that increased viral load is often associated with broad CTL responses early in infection that persist as an "immunological footprint". Conversely, early, restricted responses may help limit viral load. Phylogenetic and functional evidence of viral escape is seen in Gag, Nef and Pol. Gag and Nef show flanking epitope changes restricted by non-HLA-A2 alleles. As far as modes of viral adaptation, CTL responses were seen to develop both against static viral populations resulting in viral evolution to HLA-A2 as well as against existing mutants resulting in reselection of consensus B-like variants. This study reinforces that CTL immune responses detected are not necessarily beneficial to patients, but may be "footprints" from early effective responses that the virus has since escaped.
- A minor response was detected against an E98D variant of this epitope, KEKGGLdGL.

Country China
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining, Other
Keywords assay standardization/improvement, optimal epitope
References Wang *et al.* 2007c
- HLA-A11-restricted CTL epitopes in 2 male Han Chinese subjects (one ART naive and one receiving HAART) were determined. A novel epitope was discovered and 5 other putative epitopes confirmed using 425 overlapping peptides spanning the entire HIV-1 clade B proteome. By employing intracellular cytokine staining, the authors developed a new method of mapping optimal epitopes and defining their HLA restriction efficiently. In spite of its being the most common HLA type in China, A*11-restricted epitopes were recognized less frequently than other epitopes, and A*11-restricted responses formed a mean of only 13% of the responses against HIV.
- This epitope, KEKGGLEGL, was detected within overlapping peptide SHFLKEKGGLEGLIYSQK.

Country Australia, Canada, Germany, United States
Keywords HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-B*40-associated substitutions within optimally defined epitope KEKGGLEGL are at positions E2, E7 and L9, KeKGGLeGl.

References Draenert *et al.* 2006

- HIV-specific cellular and humoral immune responses were examined in monozygotic male twins infected simultaneously with the same virus. 15 of 17 targeted epitopes were identical in the twins, including two immunodominant responses. 3 of 4 declining responses in the twins showed mutations at the same residue. Evolving antibody responses cross-neutralized the other twin's virus. The results were compared with a third brother, infected by the twins' virus 13 months after their seroconversion. The data show similarity in disease course in persons of identical genetic background infected with the same strain of HIV-1.
- This epitope, KEKGGLEGL (KL9) restricted by HLA-B*4001, was one of two immunodominant responses.

Epitope KEKGGLEGL
Epitope name KL-9
Immunogen HIV-1 infection
Species (MHC) human (B40)
Keywords escape, TCR usage, immune evasion
References Yu *et al.* 2007b

- The dependence of TCR clonotype recruitment on genetic background was determined by studying monozygotic twins infected with the same HIV-1 strain. After an early, initial correlation in the magnitude, specificity and immunodominance of CTL response [Draenert et al. J. Exp. Med. 203:529-539(2006)], subsequent disease was mixed with respect to CTL epitopes' mutational escape. TCR alpha and beta chain repertoires were analyzed and it was found that their clonotypes in HIV-specific CTLs were broadly heterogeneous for both concordant and discordant epitope sequence evolution between the twins. Therefore initial TCR recruitment appears to be an entirely random process independent of genetic background of the infected individual.
- This epitope, KL9, showed concordant epitope evolution between the twins, but both alpha and beta TCR chains recruited were entirely different between them.

Keywords supervised treatment interruptions (STI), early treatment
References Montefiori *et al.* 2003

- HIV-1 + patient AC10 underwent early HAART treatment, which was discontinued 1.5 years later. At this timepoint potent NAb responses against autologous virus were detected. Treatment interruption initially induced weak CD8+ responses directed against 5 epitopes. By days 873d and 923d the CTL response had broadened to target 22 epitopes; of these six were fully characterized. Eventually the virus escaped the NAb response, but escape was not accompanied by a rise in viral load, and the authors suggest the virus was contained by the CTL response.

Assay type Chromium-release assay, CTL suppression of replication
Keywords escape
References Yang *et al.* 2003a

- Virus was cultured in the presence of CTL lines specific for 5 different epitopes (SLYNTVATL, ILKEPVHGV, IEIKDTKEAL, SEGATPQDL, and KEKGGLEGL) to study the emergence of escape mutations. Escape varied between clones for the same epitope, and between different epitopes. Gag and RT epitope escape, if it occurred at all, tended to be monoclonal and within the epitope, indicating strong fitness constraints, while the Nef epitope escape was rapid, polyconal, and sometimes the result of upstream frameshifts.
- Two cloned CTL lines recongized KEKGGEGL, STD11 and KM3. Highly resistant clones emerged after a single round of passage with both CTL clones, and multiple substitutions accrued including frameshits and stop codons, reflecting the dispensability of Nef in viral culture.
- The following epitope variants were observed after passaging with clone STD11 for one week: kekggegI, kKkggegl, and 12/20 frameshifts and 1 early stop. By two weeks, a more complex polyclonal mixture was observed including: kekggegI, kKkggegl kekggegP, kekggeEl, kekggeRl, kekRgeRl, keNggeRl, and 11/22 framshifts.

Keywords binding affinity, TCR usage, characterizing CD8+ T cells
References Yang *et al.* 2003b

- Killing efficiency of CTLs and their ability to suppress viral replication is shown to depend more on epitope specificity than to antigenic avidity. Different clones recognizing the same epitope had similar killing efficiency despite their variation in avidity. Nef specific CTL clones tended to be most inhibitory, followed by Gag, then by RT specific clones, regardless of avidity.
- 2/14 CTL T-cell clones tested were specific for Nef KL9. Under conditions of excess peptide (100ug/ml), there was no difference in their lytic potential; all possessed similar effector capacity. Avidity was measured as the sensitizing dose of peptide required for 50% of maximal killing (SD50), which varied from 20 pg/ml to 100 ng/ml, over four orders of magnitude for all 14 epitopes. The SD50 range for Nef KL9 was 20-30 pg/ml, both high avidity. These clones were among the most efficient at inhibiting viral replication in the set tested, but because of the general lack of correlation between avidity and viral inhibition efficiency in this study, the authors attribute other reasons to Nefs ability to inhibit viral replication that pertain to presentation like kinetics and expression levels.

References Zhao *et al.* 2007

- 46 ART-naive subjects with HIV-B infection were used to study CTL cross-responses between HIV clade B and C peptide sequences. 204/826 overlapping peptide epitopes tested were common between both clades in eliciting CTL responses that were of similar magnitude and frequency in both HIV-B and -C. Higher magnitudes and frequencies of responses were detected with peptides from Gag, Pol, Env and Nef proteins, while peptides from Rev, Vif, Vpu, Vpr and Tat were recognized less often.
- 27 peptides from immunodominant regions of higher interclade homology in Gag, Nef, Pol, Vpr, Env and Vif were found to be common between both clades in eliciting the greatest CTL responses. Although these 27 peptides differed by up to 39% between clades, CTL responsiveness was not affected.
- Cross-recognized peptides had a lower entropy of recognition than clade-B specific variants, suggesting that published conserved clade-B sequences are also more conserved between clades. Consensus sequences therefore occurred in virus regions of low intra-clade entropy and high inter-clade homology.
- 18/27 highly immunogenic clusters were previously reported by Frahm et al. [J. Virol. 78:2187-2200 (2004)].
- This peptide, GLEGLIYSqKRQdILDLW differs from the consensus C sequence GLEGLIYSkKRQeILDLW at 2 amino acid positions, i.e. by 11.1%.

CTL CD8+

HXB2 Location Nef (97–111)

Immunogen HIV-1 infection
Species (MHC) human (A24)
Donor MHC A24, A25, B18, B7, Cw12, Cw7
Country United States
Assay type Cytokine production, Flow cytometric T-cell cytokine assay, Degranulation, CD107a and b cell surface mobilization
Keywords supervised treatment interruptions (STI), immunodominance, variant cross-recognition or cross-neutralization, characterizing CD8+ T cells, drug resistance
References Daucher *et al.* 2008

- A detailed analysis of 6 chronically infected patients' CTL responses to autologous virus was performed after ART and SIT (structured interruption of therapy). Qualitative responses including degranulation and production of IFN-gamma, MIP-1beta, TNF-alpha, IL-2, but not memory CD27, CD45RO and CD57 T cells correlated with extended low plasma viremia. Frequency and breadth of CTL response as well as immune escape did not influence virological outcome.
- One patient exhibited drug resistance mutations K170R (to NNRTI efavirenz) and D76N, K70R (to NRTIs).
- Data confirmed that autologous epitopes were preferentially recognized over optimal, consensus sequences.
- Patients with favorable virological outcomes demonstrated CTL recognition within multiple, conserved regions of Gag and Nef.
- Patients with poor virological outcomes recognized optimal epitopes with much lower frequencies, though this was not significant.
- HLA-A24-restricted epitope, IHSQRRQDI, elicited a response in 1 patient and is found in Nef immunodominant region IHSQRRQDILDLWIYGTQG. Patient autologous sequence was IySQkRQDI.

Subtype B
Immunogen HIV-1 infection, peptide-HLA interaction
Species (MHC) human
Assay type CD8 T-cell Elispot - IFNγ
Keywords immunodominance
References Rolland *et al.* 2007b

- Resemblance between viral and host peptides may preclude immune reactivity against such epitopes. This was shown using ELISpot to test recognition against the entire viral genome in 314 HIV-infected subjects. Also, 944 overlapping Nef variants were tested for 30 patients. This inverse relationship between similarity of HIV epitope to host proteome and its immunogenicity has implications in vaccine design.
- Other factors, however, like entropy effects and forbidden residue usage or even hydrophobicity or disorder prediction scores were more influential than this similarity to self, with regards to immunogenicity of HIV-1. Also, forbidden aa ratios at the C-terminus of CTL epitopes and similarity to host proteins are positively correlated. Low disorder peptides elicit broader CTL responses and are better recognized.
- This HIV-1 epitope, IYSQKRQDI, is similar to human protein Ig heavy chain variable region, sequence tYSQKfQDI.

Assay type CD8 T-cell Elispot - IFNγ
Keywords subtype comparisons, immunodominance
References Zhao *et al.* 2007

- 46 ART-naive subjects with HIV-B infection were used to study CTL cross-responses between HIV clade B and C peptide sequences. 204/826 overlapping peptide epitopes tested were common between both clades in eliciting CTL responses that were of similar magnitude and frequency in both HIV-B and -C. Higher magnitudes and frequencies of responses were detected with peptides from Gag, Pol, Env and Nef proteins, while peptides from Rev, Vif, Vpu, Vpr and Tat were recognized less often.
- 27 peptides from immunodominant regions of higher interclade homology in Gag, Nef, Pol, Vpr, Env and Vif were found to be common between both clades in eliciting the greatest CTL responses. Although these 27 peptides differed by up to 39% between clades, CTL responsiveness was not affected.
- Cross-recognized peptides had a lower entropy of recognition than clade-B specific variants, suggesting that published conserved clade-B sequences are also more conserved between clades. Consensus sequences therefore occurred in virus regions of low intra-clade entropy and high inter-clade homology.
- 18/27 highly immunogenic clusters were previously reported by Frahm et al. [J. Virol. 78:2187-2200 (2004)].
- This peptide, qKRQdILDLWVYHTQGYF differs from the consensus C sequence kKRQeILDLWVYHTQGYF at 2 amino acid positions, i.e. by 11.1%.

Keywords binding affinity, immunodominance
References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, QKRQDILDLWVYHTQGYF, had an overall frequency of recognition of 26% - 28.8% AA, 26.9% C, 25% H, 19% WI. This peptide is included in a 54 aa Nef highly reactive region to be used for vaccine design. It is also part of 'Region II', QKRQDILDLWVYHTQGYFPDWQNYTPGPGIRYPLTFGWCFKLVPVEPEKVEEAN, a 54 aa region recognized by >90% of subjects across ethnic groups.

Country South Africa
Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay
Keywords rate of progression
References Gray *et al.* 2009

- 47 HIV-1 subtype C infected patients were followed longitudinally to determine whether there was a relation between magnitude and breadth of CTL responses in primary, acute infection (measured by IFN-gamma ELISpot) and disease progression (measured as viral load at 12 months). CTL responses to Nef were dominant (targeting 6 epitopic regions), followed by responses to Gag, Pol, Rev, Vpr, Env, Vpu, Vif and finally Tat.
- Known epitope KRQDILDLWVY is HLA-Cw*0701-restricted. Response to a peptide containing this epitope was detected in a rapid progressor 12 weeks post-infection.

Assay type CD8 T-cell Elispot - IFNγ
Keywords cross-presentation by different HLA, characterizing CD8+ T cells
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Immunogen HIV-1 infection
Species (MHC) human (Cw07)
Assay type CD8 T-cell Elispot - IFNγ, HLA binding
Keywords binding affinity, immunodominance, optimal epitope
References Bihl *et al.* 2006

- CTL responses were tested for both HIV-1 and EBV derived epitopes restricted by HLA-A, -B and -C alleles. HLA-B alleles more frequently induce detectable responses and that the responses are generally of greater magnitude than those for HLA-A and -C alleles.
- The magnitude and frequency of CTL recognition were related to each other and that TCR avidity for HLA/peptide complexes is a more important determinant for magnitude of response than peptide binding affinity to HLA.
- EBV response patterns were not significantly altered by HIV coinfection.
- Epitope RRQDILDLWIY elicited a magnitude of response of 460 SFC with a functional avidity of 0.0005nM.

Keywords characterizing CD8+ T cells
References Streeck *et al.* 2008a

- T-cells were studied for exhaustion and dysfunction in chronic HIV infection. Polyfunctionality of CTL immune response to HIV-1 decreased with persistence of antigen presence over time in chronic infection. CTL exhaustion can thus be halted by reduction in viral antigen load - either by ART or through escape mutations.
- PD-1, marker for activation and apoptosis increases over time, but it decreases when epitope mutations develop. CD127 however, is not impacted by viral escape.
- This epitope, KRQDILDLWVY, went from polyfunctional to monofunctional in the response it was able to elicit, without epitope variations. Previously published HLA-restriction for KY11 is HLA-Cw7.

Country United States
Assay type CD8 T-cell Elispot - IFNγ, Other
References Balamurugan *et al.* 2008

- To check whether unsuccessful vaccines may interfere with normal patient immune response,2 subjects were followed. The first, 00015, was seronegative while receiving vaccination, but later contracted infection. The second, 00016, had temporary sexual contact with subject 00015 and showed symptoms of disease 2 weeks before him. Without treatment, both reached low chronic viremic levels, and showed similar magnitude of immune response.
- Similar immune pressure was seen on viral sequences in both patients, over time in Gag, Pol, Nef.
- Data suggest that the vaccine failed to prime subject 00015 against HIV infection, but it did not impair ability to naturally contain viremia in comparison with infecting subject 00016.
- CTL immune response to consensus sequence KRQDILDL-WVY was elicited in subject 00016. Consensus epitope of both subjects was KRQeILDLWVY.

HXB2 Location Nef (105–119)

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 19% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Keywords epitope processing, immune evasion, viral fitness and reversion, HLA associated polymorphism
References Honeyborne *et al.* 2007

- To determine whether HLA-B*13-restricted CTL responses could partially explain low viremic loads in patients, a cohort of chronic C-clade infected subjects was studied. 6 novel B*13-restricted CTL epitopes were defined from both C- and B-clade viruses, 3 of which were within Gag. B*13-restricted CTL responses correlated with lower viremia, with most immunity targeted against Gag epitopes (p15, p17, p24). Gag epitope escape variants may exact a high viral fitness cost, mutations being seen within and around the optimal epitope.

Keywords subtype comparisons, computational epitope prediction, immunodominance
References Thakar *et al.* 2005

- PBMCs from HIV-1 infected Indian subjects were tested for HIV-1 Gag (with C clade peptides), Nef (with B clade peptides), and Env (clade B peptides) specific T-cell responses. 5 immunodominant regions conserved across clades were identified in Gag and Nef. 3 antigenic regions were found to be recognized by CTLs in the Indian subjects; these regions were not identified as immunodominant in studies from Africa.
- PBMCs from HIV-1 infected Indian subjects were tested for HIV-1 Gag (with C clade peptides), Nef (with B clade peptides), and Env (clade unspecified) specific T-cell responses. 5 immunodominant regions conserved across clades were identified in Gag and Nef. 3 antigenic regions were found to be recognized by CTLs in the Indian subjects; these regions were not identified as immunodominant in studies from Africa.
- 26 epitopes were predicted within reactive peptides, of which 90% were clustered in the conserved immunodominant regions of Gag and Nef.
- 3 of the epitopes were highly conserved across clades, and 7 novel epitopes were found.
- Epitope QDILDLWIY showed some conservation to subtype B. It is predicted to be restricted by HLA-B*37 or -Cw*0602.

Assay type CD8 T-cell Elispot - IFNγ
Keywords computational epitope prediction, HLA associated polymorphism
References Pérez *et al.* 2008

- Bioinformatic prediction using NetCTL 1.0, Episelect and NetMHCpan generated 184 CTL epitopes from Gag, Pol, Nef, Env and Tat in HIV subtypes A, B, C, D and CRF01_AE, restricted by MHC A1, A2, A3, A24, B7, B44 and B58. 45 of the 114 epitopes recognized experimentally in subjects were novel, and an elite subgroup comprising 21 epitopes were recognized by at least 13% of patients tested.
- Response magnitude was high—Gag and Nef, Env, Tat in descending order). While Gag, Pol, Env and Nef were highly immunocgenic, only 38% Tat epitopes elicited a response.
- 4 patterns of cross-subtype recognition found were (a) conserved epitopes recognized by patients infected with several HIV subtypes (b) infrequently found reference epitopes recognized by patients infected with several HIV subtypes (c) epitopes more prevalent in certain subtypes recognized by patients infected with several subtypes (d) rarely, subtype-specific epitopes unable to elicit cross-clade recognition
- Epitope QEILDLWVY is predicted to be restricted by HLA supertype B44. It was recognized by at least 4 patients with restricting HLA supertype who were infected with several different HIV subtypes.

Keywords binding affinity, acute/early infection, early-expressed proteins
References Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

Species (MHC) human (Cw7)
Donor MHC A24, A25, B18, B7, Cw12, Cw7
Country United States
Assay type Cytokine production, Flow cytometric T-cell cytokine assay, Degranulation, CD107a and b cell surface mobilization
Keywords supervised treatment interruptions (STI), variant cross-recognition or cross-neutralization, characterizing CD8+ T cells, drug resistance
References Daucher *et al.* 2008

- A detailed analysis of 6 chronically infected patients' CTL responses to autologous virus was performed after ART and SIT (structured interruption of therapy). Qualitative responses including degranulation and production of IFN-gamma, MIP-1beta, TNF-alpha, IL-2, but not memory CD27, CD45RO and CD57 T cells correlated with extended low plasma viremia. Frequency and breadth of CTL response as well as immune escape did not influence virological outcome.
- One patient exhibited drug resistance mutations K170R (to NNRTI efavirenz) and D76N, K70R (to NRTIs).
- Autologous epitopes were preferentially recognized over optimal, consensus sequences.
- Patients with favorable virological outcomes demonstrated CTL recognition within multiple, conserved regions of Gag and Nef.
- Patients with poor virological outcomes recognized optimal epitopes with much lower frequencies, though this was not significant.
- HLA-Cw7-restricted epitope, DILDLWIY, elicited a response in 1 patient and is found in Nef immunodominant region IHSQRRQDILDLWIYGTQG. Patient autologous sequence was DILDLWvY.

Country United States
Assay type CD8 T-cell Elispot - IFNγ, Other
Keywords rate of progression, immune evasion
References Kemal *et al.* 2008

- An LTNP was followed longitudinally over 6 years and 3 sampling time points, until transition to disease. His HLA were heterozygous and not associated with nonprogressive infection, but 3 alleles were associated with poor clinical prognosis. No attenuating mutations in initial samplings, but an insertion in the V2 loop and continuing CCR5 coreceptor use were found.
- A decrease in IFN-gamma response was seen over time, suggesting CTL dysfunction. An increase in T-cell epitopes targeted (e.g. emergence of YL8, YLKDQQLL and WY20, WKFDSRLAFHHMARELHPEY variants and gain of response to EL9, EIKDTKEAL, NL10, NSNPDCKTIL, AK9, AIFQSSMTK, WM8, WSMVRERM, VT15, WVHHTQGYFPDWQNYT) was seen concomitant with disease progression, reflecting viral replication and/or variants.
- HLA-Cw7-restricted epitope DILDLWVH failed to generate CTL response. HLA restriction was predicted in this study based on the patient's HLA alleles and previous publication.

Keywords binding affinity, immunodominance
References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, LWVYHTQGYFPDWQNY, had an overall frequency of recognition of 30% - 25.4% AA, 38.5% C, 31.8% H, 28.6% WI. This peptide is included in a 54 aa Nef highly reactive region to be used for vaccine design. It is also part of 'Region II', QKRQDILDLWVYHTQGYFPDWQNYTPGPGIRYPLTFGWCFKLVPVEPEKVEEAN, a 54 aa region recognized by >90% of subjects across ethnic groups.

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 22% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Keywords escape, viral fitness and reversion, HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- Escape (and reversion) rates for B*57-restricted epitopes were highest for Gag-TW10 (TSTLQEQIGW) > RT-IW9 (IVLPEKDSW) > Nef-YY9 (YTPGPGIRY) > Nef-HW9 (HTQGYFPDW) > Gag-IW9 (ISPRTLNAW) > Gag-KF11 (KAFSPEVIPMF) .
- HLA-B*57-associated substitution within optimally defined epitope HTQGYFPDW is at position H1, hTQGYFPDW. HW9 has a recognition frequency of ∼40% and its escapes appear at around months 3 and 12 post-infection.

- 96% of optimally defined epitopes have one of only nine amino acids serving as the C-terminal anchor position. Seven amino acids are never found in this position and four are only present in 4% of cases. CD8 T-cell response to an epitope is shown to be best detected when the epitope is situated at the C-terminal end of a longer peptide, and authors suggest that Elispot reagents would be better designed if peptides ended on known C-terminal anchors.
- HTQGYFPDW is suggested to be the optimal epitope instead of HTQGYFPDWQ since Gln is not described as a C-terminal anchor residue in any of the other optimally defined epitopes. HTQGYFPDW was also found to be recognized at two times lower peptide concentrations than HTQGYFPDWQ.

Keywords responses in children, mother-to-infant transmission, escape, acute/early infection
References Pillay *et al.* 2005

- HIV-specific CTLs in infants were shown to be able to select for viral escape variants early in life, despite a lack of escape with the same CTL specificity in the mother. Infant CTL responses may be compromised by transmission of escape variants that arose in the mother and also those that arose in the father, if the father was the source of the mother's infection.
- HTQGYFPDW is the C consensus form of the epitope; the autologous form in the mother was HTQGfFPDW, and this was transmitted to her infant. By 33 weeks a new dominant form of the epitope had emerged in the infant: nTQGfFPDW.

HXB2 Location Nef (116–124)

Epitope HTQGYFPDW
Epitope name B57-HW9(Nef)
Immunogen HIV-1 infection
Species (MHC) human (B57)
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, immunodominance, early-expressed proteins
References Altfeld *et al.* 2006

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognised epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.

HXB2 Location Nef (116–124)
Author Location Nef
Epitope HTQGYFPDW

Epitope name HW9
Immunogen HIV-1 infection
Species (MHC) human (B*5801, B57)
Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay
Keywords responses in children, mother-to-infant transmission, escape, characterizing CD8+ T cells
References Feeney *et al.* 2005

- Escape mutations in TW10 and other B57-restricted epitopes were shown to arise early in infants following perinatal infection. Some escape variants were likely to have been transmitted vertically, from HLA-B57/5801 positive HIV-1 infected mothers, while others arose during infancy in cases where the children inherited the B57/5801 allele paternally. In contrast to adults, the majority of children showed a robust response to the escape variants, suggesting that infants are able to mount functional immune responses and drive immune escape and that a developing immune system may exhibit greater plasticity in recognizing viral variants.
- While 2 mothers carried the form HTQGYFPDW, their children carried the escape H1N variant nTQGYFPDW.

Epitope `HTQGYFPDWQ`
Epitope name HQ10
Immunogen HIV-1 infection
Species (MHC) human (B*57)
Assay type CD8 T-cell Elispot - IFNγ
Keywords escape
References Bailey *et al.* 2006b

- Impact of CTL escape mutations in HLA-B57 positive elite supressors was examined. Escape mutations in B57-restricted Gag epitopes were present in all viruses derived from plasma but were lacking in proviruses, suggesting a strong selective pressure acting upon virus in plasma. IFN-gamma responses were detected to both wild-type epitopes and mutant plasma virus epitopes. In some individuals, CD8 IL-2 secretion, rather than IFN-gamma responses, showed better correlation with the plasma viral variants.
- HLA-B*57-restricted optimal epitope HTQGYFPDWQ was tested for immune response.

Immunogen HIV-1 infection
Species (MHC) human (B*57)
Country Switzerland
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, escape, HLA associated polymorphism
References Frater *et al.* 2007

- To study whether CTL responses restricted by "good" HLA I molecules exert stronger immune selection than other HLA I molecules, 54 and 70 optimal epitopes within HIV-1 Gag, Pol and Nef genes for Caucasian and African cohorts were tested in patients over a mean of 14 months. "Good", advantageous HLA allele-restricted epitopes were much more polymorphic than epitopes restricted by other, non-advantageous HLA in patients, suggesting that benefits associated with HLA Class I alleles of elite controllers of disease progression are epitope-specific. Such "driver" epitopes with high polymorphism had high frequency of immune response, allowing them to be ranked for recognition and polymorphism.
- Patients with higher proportions of mutated epitopes also had lower plasma viral loads, and mean epitope variability correlated negatively with relative hazard of disease progression.
- Variant nTQGYFPDWQ at position 1 was found in 100% of HLA-matched patients and in 28.8% of HLA-unmatched patients.

References Zhao *et al.* 2007

- 46 ART-naive subjects with HIV-B infection were used to study CTL cross-responses between HIV clade B and C peptide sequences. 204/826 overlapping peptide epitopes tested were common between both clades in eliciting CTL responses that were of similar magnitude and frequency in both HIV-B and -C. Higher magnitudes and frequencies of responses were detected with peptides from Gag, Pol, Env and Nef proteins, while peptides from Rev, Vif, Vpu, Vpr and Tat were recognized less often.
- 27 peptides from immunodominant regions of higher interclade homology in Gag, Nef, Pol, Vpr, Env and Vif were found to be common between both clades in eliciting the greatest CTL responses. Although these 27 peptides differed by up to 39% between clades, CTL responsiveness was not affected.
- Cross-recognized peptides had a lower entropy of recognition than clade-B specific variants, suggesting that published conserved clade-B sequences are also more conserved between clades. Consensus sequences therefore occurred in virus regions of low intra-clade entropy and high inter-clade homology.
- 18/27 highly immunogenic clusters were previously reported by Frahm et al. [J. Virol. 78:2187-2200 (2004)].
- This peptide, QGYFPDWQNYTPGPgRf differs from the consensus C sequence QGYFPDWQNYTPGPvRy at 2 amino acid positions, i.e. by 11.1%.

Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords binding affinity, immunodominance
References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.

- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, QGYFPDWQNYTPGPGIRY, had an overall frequency of recognition of 30.7% - 23.7% AA, 38.5% C, 40.9% H, 19% WI. This peptide is included in a 54 aa Nef highly reactive region to be used for vaccine design. It is also part of 'Region II', QKRQDILDLWVYHTQGYFPDWQNYTPGPGIRYPLTFGWCFKLVPVEPEKVEEAN, a 54 aa region recognized by >90% of subjects across ethnic groups.

Epitope `YFPDWQNY`
Subtype C
Immunogen HIV-1 infection
Species (MHC) human (A*29, A*3002)
Country South Africa
Assay type CD8 T-cell Elispot - IFNγ
Keywords cross-presentation by different HLA, characterizing CD8+ T cells
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Assay type CD8 T-cell Elispot - IFNγ
Keywords assay standardization/improvement, epitope processing
References Draenert *et al.* 2004a

- 96% of optimally defined epitopes have one of only nine amino acids serving as the C-terminal anchor position. Seven amino acids are never found in this position and four are only present in 4% of cases. CD8 T-cell response to an epitope is shown to be best detected when the epitope is situated at the C-terminal end of a longer peptide, and authors suggest that Elispot reagents would be better designed if peptides ended on known C-terminal anchors.
- Instead of YFPDWQNYT, YFPDWQNY was found to be the optimal epitope in one patient.

Immunogen HIV-1 infection
Species (MHC) human (B*5801, B57)
Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay
Keywords responses in children, mother-to-infant transmission, escape
References Feeney *et al.* 2005

- Escape mutations in TW10 and other B57-restricted epitopes were shown to arise early in infants following perinatal infection. Some escape variants were likely to have been transmitted vertically, from HLA-B57/5801 positive HIV-1 infected mothers, while others arose during infancy in cases where the children inherited the B57/5801 allele paternally. In contrast to adults, the majority of children showed a robust response to the escape variants, suggesting that infants are able to mount functional immune responses and drive immune escape and that a developing immune system may exhibit greater plasticity in recognizing viral variants.
- YFPDWQNY responses were somewhat more frequent in adults.

References Reche *et al.* 2006

- 25 CTL epitopes with sequence conservation were studied. Population protection coverage (PPC) for 5 different ethnic groups in the US was estimated by combining HLA binding predictions and known HLA frequencies. HIV-1-naive individuals mounted a better response to the epitope pools than HIV-1 infected individuals.

- A more detailed evaluation of HIV-naive T-cell responses was undertaken, limiting the study to only those peptides that are restricted to A*0201. Though the peptides could cross-recognize and bind different HLA, they were able to specifically lyse only cells of the same (A*0201) HLA-restriction. Thus, the CTL response was less degenerate than peptide binding to MHC.
- In addition to the published restriction above, epitope YFPDWQNYT was predicted to be restricted by A1, B*3701 and B*5701.

Keywords characterizing CD8+ T cells
References Streeck *et al.* 2008a

- T-cells were studied for exhaustion and dysfunction in chronic HIV infection. Polyfunctionality of CTL immune response to HIV-1 decreased with persistence of antigen presence over time in chronic infection. CTL exhaustion can thus be halted by reduction in viral antigen load - either by ART or through escape mutations.
- PD-1, marker for activation and apoptosis increases over time, but it decreases when epitope mutations develop. CD127 however, is not impacted by viral escape.
- A variant of YFPDWQNYT, fFPDWQNYT was found in a different untreated patient whose epitope also did not vary with time.
- 215 days after first testing, this epitope, YFPDWQNYT, went from 3-4 functional to monofunctional in the response it was able to elicit, with no variation in an untreated patient. Previously published HLA-restriction for YT9 is HLA-A1.

- In order to reconcile apparent conflicts between a CTL-protective role as suggested by HLA-1 alleles associated with different rates of progression to AIDS, and a CTL non-protective role as suggested by the fact that virus clearance following ART is not impaired in advanced AIDS, a model is made that quantifies the efficiency of HIV-1-specific CTLs in vivo. As a surrogate for the actual rate of CTL-killing of infected cells, the model rests on calculating virus escape rate for an epitope and subtracting its reversion rate upon transmission to a non-restricting HLA bearing host. It is shown that CTLs recognizing a single epitope kill only 2% of productively infected CD4+ cells. The rate of CTL lysis was found to be significantly faster during primary infection than in chronic infection. However, the authors suggest that small differences in CTL lysis rate can translate into large differences in terms of absolute numbers of infected cells killed, which are likely to be clinically relevant.
- The best estimate of escape rate for this epitope, YFPDWQDYT, was found to be 0.002/day (optimistic escape rate = 0.012), with SE of 0.001.
- In the subject studied, the fluctuating outgrowth of a Q125D mutation in Nef was observed over a period of 1,361 days.

Author Location Nef (121–128 HXB2)
Epitope FPDWQNYT
Subtype B, CRF01_AE
Immunogen HIV-1 infection
Species (MHC) human (A1)
Country Viet Nam
Assay type HLA binding
Keywords subtype comparisons, computational epitope prediction, variant cross-recognition or cross-neutralization, vaccine antigen design
References Lazaro *et al.* 2005
- The most common HLA-alleles in the Vietnamese population were found to be HLA-A11, A02, A33, B75, B46, and B62. Several epitopes cluster in short regions in Gag and Nef that are presented by these HLA molecules; these epitopes may be useful targets for vaccine antigens. In a comparison of CRF01_AE sequences to HXB2, 14 mutations were found in epitopes in these Gag and Nef pluriepitopic regions; 7 did not affect the HLA binding score, 3 increased it, and 4 reduced it.

- CRF01_AE has 2 forms, FPDWQNYT, like the HXB2 form, and FPDWhNYT. Both are predicted to bind to A1.

Epitope QNYTPGPGRFPLTFGWCF
Epitope name NEF-18
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country China
Assay type CD8 T-cell Elispot - IFNγ
Keywords subtype comparisons, immunodominance
References Zhao *et al.* 2007

- 46 ART-naive subjects with HIV-B infection were used to study CTL cross-responses between HIV clade B and C peptide sequences. 204/826 overlapping peptide epitopes tested were common between both clades in eliciting CTL responses that were of similar magnitude and frequency in both HIV-B and -C. Higher magnitudes and frequencies of responses were detected with peptides from Gag, Pol, Env and Nef proteins, while peptides from Rev, Vif, Vpu, Vpr and Tat were recognized less often.
- 27 peptides from immunodominant regions of higher interclade homology in Gag, Nef, Pol, Vpr, Env and Vif were found to be common between both clades in eliciting the greatest CTL responses. Although these 27 peptides differed by up to 39% between clades, CTL responsiveness was not affected.
- Cross-recognized peptides had a lower entropy of recognition than clade-B specific variants, suggesting that published conserved clade-B sequences are also more conserved between clades. Consensus sequences therefore occurred in virus regions of low intra-clade entropy and high inter-clade homology.
- 18/27 highly immunogenic clusters were previously reported by Frahm et al. [J. Virol. 78:2187-2200 (2004)].
- This peptide, QNYTPGPgRfPLTFGWCF differs from the consensus C sequence QNYTPGPvRyPLTFGWCF at 2 amino acid positions, i.e. by 10.5%.

HXB2 Location Nef (126–135)
Author Location Nef (126–135 BRU)
Epitope NYTPGPGVRY
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A24)
Keywords binding affinity, epitope processing
References Choppin *et al.* 2001

- Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The strength of HLA-peptide binding was not directly related to the number of individuals that recognized a protein.
- 20s proteasome cleavage of the Nef protein positions 66-100 showed a large fraction of peptides were cleaved ending at: 87L, 83A, 81Y, 71P, 68F and 67G. The frequency of recognition may be in part dictated by the cleavage step in processing.
- NYTPGPGVRY was recognized in 3/10 (30%) of individuals with HLA A24. It was a moderate affinity HLA-A24 binder.

Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country Barbados, Haiti, United States
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords binding affinity, immunodominance
References Frahm *et al.* 2004
- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, NYTPGPGIRYPLTFGWCF, had an overall frequency of recognition of 37.3% - 42.4% AA, 38.5% C, 31.8% H, 33.3% WI. This peptide is included in a 54 aa Nef highly reactive region to be used for vaccine design. It is also part of 'Region II', QKRQDILDLWVYHTQGYFPDWQNYTPGPGIRYPLTFGWCFKLVPVEPEKVEEAN, a 54 aa region recognized by >90% of subjects across ethnic groups.

HXB2 Location Nef (127–135)

Epitope `YTPGPGIRY`
Epitope name YY9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B*57)
Country Australia, Canada, Germany, United States
Keywords escape, viral fitness and reversion, HLA associated polymorphism
References Brumme *et al.* 2008a
- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- Escape (and reversion) rates for B*57-restricted epitopes were highest for Gag-TW10 (TSTLQEQIGW) > RT-IW9 (IVLPEKDSW) > Nef-YY9 (YTPGPGIRY) > Nef-HW9 (HTQGYFPDW) > Gag-IW9 (ISPRTLNAW) > Gag-KF11 (KAFSPEVIPMF) .
- HLA-B*57-associated substitution within optimally defined epitope YTPGPGIRY is at position I7, YTPGPGiRY. YY9 has a recognition frequency above 20% and its escapes appear by 3 months post-infection.

Keywords cross-presentation by different HLA, optimal epitope
References Frahm *et al.* 2005

- HLA-B63-positive subjects were shown to be able to generate CTL responses early in acute HIV infection and to control HIV replication in the absence of antiretroviral treatment. Since HLA-B63 shares the epitope binding motif of HLA-B57 and -B58, it was shown that HLA-B63-positive individuals mounted CTL responses to previously identified B57-restricted epitopes, as well as novel, B63-restricted epitopes. Moreover, these novel B63-restricted epitopes can also be presented by HLA-B57 and -B58.
- This is a putative HLA-B63/57/58 epitope containing the B58 supertype binding motif. The optimal epitope was defined in a person carrying B57, and reactivity to the peptide was enriched in those with B57/B58, just a trend for B63.

Keywords escape, acute/early infection
References Bansal *et al.* 2005

- Patients with acute or early infection were shown to preferentially target variable peptides with higher entropy while those with chronic infection showed responses towards more conserved peptides with lower entropy. In longitudinally followed subjects, responses to variable proteins declined over time while responses to conserved proteins increased. The decline is suggested to be due to CTL escape.
- Point mutation at position 2 (P to S, TsGPGVRYPL) was detected at a chronic infection time point, month 33. This escape variant had lower avidity.
- The response to the peptide that carried this epitope was initially strong and diminished over time.

Country South Africa
Assay type CD8 T-cell Elispot - IFNγ
Keywords responses in children, mother-to-infant transmission, escape, acute/early infection
References Pillay *et al.* 2005

- HIV-specific CTLs in infants were shown to be able to select for viral escape variants early in life, despite a lack of escape with the same CTL specificity in the mother. Infant CTL responses may be compromised by transmission of escape variants that arose in the mother and also those that arose in the father, if the father was the source of the mother's infection.
- Escape variants tSgpgvrypl and tQgpgvrypl were rapidly selected in an infant, by 26 weeks, but were not found in the infant's mother. These forms were demonstrated to be escape mutations by Elispot, and also had reduced binding to B*4201 in a competitive inhibition assay.

Assay type CD8 T-cell Elispot - IFNγ
Keywords cross-presentation by different HLA, characterizing CD8+ T cells
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Epitope TPGPGVRYPL
Immunogen HIV-1 infection
Species (MHC) human (B07)
Assay type CD8 T-cell Elispot - IFNγ, HLA binding
Keywords binding affinity, immunodominance, optimal epitope
References Bihl *et al.* 2006

- CTL responses were tested for both HIV-1 and EBV derived epitopes restricted by HLA-A, -B and -C alleles. HLA-B alleles more frequently induce detectable responses and that the responses are generally of greater magnitude than those for HLA-A and -C alleles.
- The magnitude and frequency of CTL recognition were related to each other and that TCR avidity for HLA/peptide complexes is a more important determinant for magnitude of response than peptide binding affinity to HLA.
- EBV response patterns were not significantly altered by HIV coinfection.
- Epitope TPGPGVRYPL elicited a magnitude of response of 210 SFC with a functional avidity of 0.5nM and binding affinity of 5.1nM.

HXB2 Location Nef (128–137)
Author Location Nef (128–137 BRU)
Epitope TPGPGVRYPL
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B35)
Keywords binding affinity, epitope processing
References Choppin *et al.* 2001

- Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The strength of HLA-peptide binding was not directly related to the number of individuals that recognized a protein.
- 20s proteasome cleavage of the Nef protein positions 66-100 showed a large fraction of peptides were cleaved ending at: 87L, 83A, 81Y, 71P, 68F and 67G. The frequency of recognition may be in part dictated by the cleavage step in processing.
- TPGPGVRYPL was recognized in 8/16 (50%) of individuals with HLA B7, and 1/9 (11%) of individuals with HLA B35. It was a high affinity HLA binder.

Epitope TPGPGTRYPL
Epitope name TL10
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B35)
Country United States
Assay type CD8 T-cell Elispot - IFNγ
Keywords assay standardization/improvement, acute/early infection, immune evasion
References Malhotra *et al.* 2007a

- The ability of T cells from early infected subjects to recognize Nef clade B HIV-1 epitope variants was tested using both a consensus peptide panel and a standardized potential T-cell epitope panel (PTE-B). The magnitude and breadth of PTE-optimized peptide panels was significantly higher than CON peptides'. 29 potential epitopic domains were detected in Nef using the PTE peptide set.
- 2 PTE-B peptide sequences were identified, NYTPGPGtRYPLTFG and YTPGPGvRYPLTFGW, containing variants of this consensus epitope sequence TL10, viz. TPGPGtRYPL and TPGPGvRYPL, both of which elicited a IFN-gamma immune response.
- HLA-B35 restriction for TL10 was presumed based on the subject having the HLA allele and publication in the Los Alamos database.

HXB2 Location Nef (128–137)
Author Location
Epitope TPGPGVRYPL
Immunogen HIV-1 infection
Species (MHC) human (B7)
Keywords acute/early infection
References Wilson *et al.* 2000a

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load was also found.

CTL CD8+

- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B*2705; and A*0201, A*0301, B*2705, B39.
- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWIILGGLNK.
- The subject with A*0201 had a moderately strong response to SLYNTVATL.
- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.
- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

Epitope TPGPGVRYPL
Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (B7)
Keywords HIV exposed persistently seronegative (HEPS), immunodominance
References Kaul *et al.* 2001a

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.

- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B7 women, 4/5 HEPS and 5/6 HIV-1 infected women recognized this epitope.
- The dominant response to this HLA allele was to this epitope in 3 of the 4/5 HEPS cases and in 2 of the 5/6 HIV-1 infected women.
- Subject ML 1203 started with CTL responses to A*6802 DTVLEDINL and to B7 FPVTPQVPLR prior to seroconversion, and upon seroconversion acquired additional responses to A*6802 ETAYFILKL which became dominant, B7 TPGPG(V/I)RYPL, B7 IPRRIRQGL, and B7 SPRTLNAWV.

Keywords supertype, cross-presentation by different HLA, TCR usage, HLA associated polymorphism
References Leslie *et al.* 2006

- 14 promiscuous HIV-specific CTL epitopes presented by B7 supertype alleles were described. It was shown that CTLs targeting an identical epitope that are restricted by closely related but different HLA alelles differ in several ways: by occurrence of distinct HLA-specific escape mutations, by recruitment of distinct TCRs by peptide/MHC complexes, and by functional avidity of CTLs. Since there were no differences in the frequency, magnitude or immunodominance of the CTL responses restricted by different HLA alleles, it is suggested that the unique peptide/MHC complexes generated by closely related HLA induce qualitatively different CTL responses.
- Functional avidity is correlated with selection pressure observed in HLA allele-epitope restriction
- Statistically significant associations between numbers of HLA-0702 and -B4201 expressing subjects and epitope TPGPGVRYPL were found.
- Only B*0702 was found to be associated with polymorphism in TL10.

Epitope TPGPGRFPL
Epitope name TL10(Nef)
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country China
Assay type CD8 T-cell Elispot - IFNγ
Keywords variant cross-recognition or cross-neutralization
References Zhai *et al.* 2008

- 49 ART-naive chronically HIV-1 infected Chinese subjects' CTLs were tested with 413 OLPs in IFN-gamma assays, determining optimal epitopes specific for Chinese Clade B HIV-1 sequences.
- An inverse correlation was found between CTL response and viral load.
- Targeted peptides have lower entropy than peptides that are not CTL targeted. This correlation is independent of HLA-restriction.
- Author defined epitope TPGPGRFPL elicited an immune response in Chinese HIV-1 positive subjects as part of peptide QNYTPGPGRFPLTFGWCF. This epitope differs from the previously described HLA-B7 epitope TPGPGVRYPL, at 1 residue, TPGPGrf-PL.
- 1 of the 9 HLA-B7 carriers responded to TPGPGrf-PL-containing peptide with average magnitude of CTL response of 120 SFC/million PBMC (author communication and Fig.1).

Assay type CD8 T-cell Elispot - IFNγ
Keywords HAART, ART, mother-to-infant transmission, rate of progression, co-receptor, immune evasion, HLA associated polymorphism
References Reinis *et al.* 2007

- HIV-1 mother-to-child transmission is studied for LTNPs by comparing entire genomes from 2 mother (M1, M2) and 2 daughter (D1, D2) RNA samples of a mother-child pair over 11 years. Genetic distance was 94% between subjects' strains. Divergence in sequences was attributed to distinct HLA selection pressures as ds/dn was larger for intra- rather than interperson sequences. 10 new mutations in D2 were found related to unique daughter HLA alleles.
- Functional ELISpot studies using D2 and Nef peptides reveal strong associations between CTL responses and escape variants, contributing to delayed progression.
- LTNP status was not related to defective virus since all viral genes were intact and CTL response did not effectively control viral load. It is supposed that genetic HLA background and HIV-1 epitope-immune response interaction account for nonprogression of disease.
- All isolates contained R77Q in Vpr, a variation associated with reduction of cellular apoptosis.
- This Nef overlapping peptide, PGPGIRYPLTFGWCF was mutated in the daughter D2 isolate to PGPGtRfPLTFGWCF.

HXB2 Location Nef (130–139)
Author Location Nef (130–139 BRU)
Epitope `GPGVRYPLTF`
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B35)
Keywords binding affinity, epitope processing
References Choppin *et al.* 2001

- Seventy-three 8-11 mer peptides were generated based on putative anchor motifs in the Nef BRU sequence for HLA A2, A3, A24, B7, B8, and B35; these 73 peptides had 81 motifs. 54% bound to the predicted HLA molecule, particularly A2, B7/35, and B8. The strength of HLA-peptide binding was not directly related to the number of individuals that recognized a protein.

CTL CD8+

- 20s proteasome cleavage of the Nef protein positions 66-100 showed a large fraction of peptides were cleaved ending at: 87L, 83A, 81Y, 71P, 68F and 67G. The frequency of recognition may be in part dictated by the cleavage step in processing.
- GPGVRYPLTF was recognized in 0/10 (0%) of individuals with HLA B7, and 1/11 (9%) of individuals with HLA B35, although it was a high affinity HLA binder.

HXB2 Location Nef (130–139)

Epitope GPGIRYPLTFGWCF
Epitope name GF14
Immunogen HIV-1 infection
Species (MHC) human (B*57)
Assay type CD8 T-cell Elispot - IFNγ
Keywords escape
References Bailey *et al.* 2006b

- Impact of CTL escape mutations in HLA-B57 positive elite supressors was examined. Escape mutations in B57-restricted Gag epitopes were present in all viruses derived from plasma but were lacking in proviruses, suggesting a strong selective pressure acting upon virus in plasma. IFN-gamma responses were detected to both wild-type epitopes and mutant plasma virus epitopes. In some individuals, CD8 IL-2 secretion, rather than IFN-gamma responses, showed better correlation with the plasma viral variants.
- HLA-B*57-restricted peptide GPGIRYPLTFGWCF was tested for immune response.

Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Assay type T-cell Elispot
Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 24% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Evaluation in their method was conducted by testing Nef-specific CTL responses in four HIV-1 subtype B infected subjects. It was found that peptides autologous to HIV-1 immunogen sequence were the best for vaccine design and that vaccine response evaluation was better performed using peptide sets from circulating strains of HIV-1.
- The peptide, TRYPLTFGWCyKLVP, varies at position 11 from the consensus peptide IRYPLTFGWCFKLVP.

Assay type CD8 T-cell Elispot - IFNγ
Keywords characterizing CD8+ T cells
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Keywords viral fitness and reversion, HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-A*24-associated substitutions within optimally defined epitope RYPLTFGW are at positions Y2 and F6, RyPLTfGW. Codon 135, i.e. RW8 position Y2 was the most rapidly reverting Nef epitope-associated mutation.

Immunogen peptide-HLA interaction
Species (MHC) human (A*2402)
Assay type Tetramer binding
Keywords binding affinity
References Gillespie *et al.* 2007

- MHC can exert a protective effect on HIV-1 disease progression by the interaction of MHC Class I molecules with Killer Inhibitory Receptors (KIR) of the innate immune system. Here, KIR3DS1, a putative stimulatory receptor and allele of the inhibitory KIR3DL1, is studied. Bw4 MHC Class I proteins were implicated in this KIR's ligand specificity, but the authors were unable to generate binding of Bw4Ile80 tetramers in complex with epitopes to KIR3DS1 transiently expressed on 293-T cells, using a panel of HIV-epitopes differing at p7 and p8.
- This epitope, RYPLTFGW (MHC Class I restriction, serotype Bw4) complexed with MHC A*2402 as a tetramer was unable to bind KIR3DS1 at 4, 20 and 37C. However, the A*2402-KYKLKHIVW complex does bind inhibitory KIR3DL1 subtype KIR3DL1*005.

Keywords HAART, ART, supervised treatment interruptions (STI)
References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (`http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html`) for each person's class I HLA alleles.

CTL CD8+

- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient C displayed the greatest response to B27-KK10(p24), and in decreasing order also responded to A24-RW8(Nef), B7-IL9(gp41), A24-RL9(gp41), A24-YL8(gp41), and B7-TM9(Nef).

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.

- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Assay type CD8 T-cell Elispot - IFNγ
Keywords acute/early infection, variant cross-recognition or cross-neutralization, superinfection, characterizing CD8+ T cells
References Yang *et al.* 2005b

- An individual infected with a drug-resistant strain of HIV-1 subtype B with controlled viremia became superinfected with another subtype B strain. The second strain outgrew the first despite lower replication capacity and the same viral phenotype. The strains showed differences in their epitope sequences. The CTL responses to the first strain declined after superinfection, followed by some adaptation of targeting to the new epitopes of the second strain. Differences in the recognized epitopes were suggested to have contributed to the poor immune containment of the second strain.
- The response to the peptide that carried this epitope, RYPLTFGWCF, was present before superinfection but waned afterward. The epitope from the second strain had a mutation, ryplCfgwcf. A second overlapping epitope in the reactive peptide might be involved, the B*35 epitope YPLTFGWCF.

Keywords binding affinity, epitope processing, immunodominance, escape
References Furutsuki *et al.* 2004

- 70% of Japanese people carry HLA A*2402, and the rFpltfgwcf (2F) escape variant of this A*2402 epitope was found to be positively selected in Japan; reversion to wild-type in HLA-A24 negative individuals occurred very slowly over years. The 2F escape variant appears to be common in Japan due to escape and then transmission of this form in the population. The mechanism of escape appeared to be in processing of Nef and antigen presentation rather than HLA binding since both wild-type and 2F variant bound to HLA-A*2402 with almost same efficiency; the authors suggest the epitope may be cleaved at position 5 with a higher frequency when the 2F mutation is present.

Assay type CD8 T-cell Elispot - IFNγ
Keywords responses in children, mother-to-infant transmission, escape, characterizing CD8+ T cells, viral fitness and reversion
References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness.
- Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- Variant rFpltfgwcf was detected in increasing frequencies in clones from an A24+ infant, but was absent in all sequences from the A24- mother at delivery, revealing selective pressure as early as 3 months of age.

Assay type CD8 T-cell Elispot - IFNγ, HLA binding
Keywords HAART, ART, escape, viral fitness and reversion
References Asquith *et al.* 2006

- In order to reconcile apparent conflicts between a CTL-protective role as suggested by HLA-1 alleles associated with different rates of progression to AIDS, and a CTL non-protective role as suggested by the fact that virus clearance following ART is not impaired in advanced AIDS, a model is made that quantifies the efficiency of HIV-1-specific CTLs in vivo. As a surrogate for the actual rate of CTL-killing of infected cells, the model rests on calculating virus escape rate for an epitope and subtracting its reversion rate upon transmission to a non-restricting HLA bearing host. It is shown that CTLs recognizing a single epitope kill only 2% of productively infected CD4+ cells. The rate of CTL lysis was found to be significantly faster during primary infection than in chronic infection. However, the authors suggest that small differences in CTL lysis rate can translate into large differences in terms of absolute numbers of infected cells killed, which are likely to be clinically relevant.
- The best estimates of reversion rates for this epitope, RYPLTFGWCY/F, in 2 subjects were found to be -0.014 and 0.005/day with SEs of 0.
- A Y135F substitution was shown to confer escape from an A24-restricted response by prevention of epitope processing. In an HLA A24- individual, the mutation rapidly reverted to wild type. Reversion of the Y135F escape mutant was observed in a second A24- individual. The model fitted the data well, giving a rate of 0.005/day. In this subject, the 135F-138C variant was out-competed by a 135Y-138C variant rather than by the wild type (135Y-138T). The rate of reversion with respect to the wild type is zero.

Epitope RYPLTFGWCFKLVPV

Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country Barbados, Haiti, United States
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords binding affinity, immunodominance
References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, RYPLTFGWCFKLVPV, had an overall frequency of recognition of 32% - 35.6% AA, 26.9% C, 31.8% H, 33.3% WI. This peptide is included in a 54 aa Nef highly reactive region to be used for vaccine design. It is also part of 'Region II', QKRQDILDLWVYHTQGYFPDWQNYTPGPGIRYPLTFGWCFKLVPVEPEKVEEAN, a 54 aa region recognized by >90% of subjects across ethnic groups.

Keywords escape, immune evasion, optimal epitope
References Liu *et al.* 2006b
- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.

Keywords acute/early infection, variant cross-recognition or cross-neutralization, superinfection
References Yang *et al.* 2005b
- An individual infected with a drug-resistant strain of HIV-1 subtype B with controlled viremia became superinfected with another subtype B strain. The second strain outgrew the first despite lower replication capacity and the same viral phenotype. The strains showed differences in their epitope sequences. The CTL responses to the first strain declined after superinfection, followed by some adaptation of targeting to the new epitopes of the second strain. Differences in the recognized epitopes were suggested to have contributed to the poor immune containment of the second strain.
- The response to the peptide that carried this epitope, YPLTFGWCF, was present before superinfection but waned afterward. The epitope from the second strain had a mutation, yplCfgwcf. A second overlapping epitope in the reactive peptide might be involved, the A*24 epitope RYPLTFGWCF.

Keywords HAART, ART, supervised treatment interruptions (STI)
References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (`http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html`) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient D displayed the greatest response to B27-KK10 (p24), and also responded to A30-RY11(p17), A32-PW10(RT), A30-KY11(RT), A32-RW10(gp120), and B18-YY9(Nef).

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Country United States
Assay type CD8 T-cell Elispot - IFNγ
Keywords assay standardization/improvement, acute/early infection, immune evasion
References Malhotra *et al.* 2007a

- The ability of T cells from early infected subjects to recognize Nef clade B HIV-1 epitope variants was tested using both a consensus peptide panel and a standardized potential T-cell epitope panel (PTE-B). The magnitude and breadth of PTE-optimized peptide panels was significantly higher than CON

CTL CD8+

peptides'. 29 potential epitopic domains were detected in Nef using the PTE peptide set.

- 5 additional variants of this epitope, YPLTFGWCF, were found using the PTE-B set - fPLTFGWCF, YPLcFGWCF, fPLcFGWCF, YPLTFGWCy and YPLTlGWCF. Only the last variant, YPLTlGWCF, was not recognized when restricted by HLA-B35. The first variant alone, fPLTFGWCF, was present as a patient autologous sequence. While no epitope variants were seen in the T-cell HLA-B18 restricted response, these T cells did react with 3 out of 6 possible epitopic variants viz. YPLTFGWCF, fPLTFGWCF and YPLTFGWCy. Each of the 6 possible variants was associated predominantly with certain HIV-1 clades: YPLTFGWCF with clades B, C, A; fPLTFGWCF with clades A, B, C; YPLTFGWCy with clades A, C; YPLTlGWCF with clade F; fPLcFGWCF with circulating recombinant forms and YPLcFGWCF with clade B.
- HLA-B18 restriction was previously fine-mapped to YF9; HLA-B35 restriction was presumed based on the subject carrying the allele and publication in the Los Alamos database.

Epitope YPLTFGWCY
Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (B18, B49)
Keywords HIV exposed persistently seronegative (HEPS), immunodominance
References Kaul *et al.* 2001a

- Variants YPLTFGWC(Y/F) are specific for the B/D clades.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B18 women, 1/4 HEPS and 8/9 HIV-1 infected women recognized this epitope, likelihood ratio 5.3, p value 0.04, and HEPS women tended to respond to FRDYVDRF(Y/F)K, while infected women tended to respond to YPLTFGWC(Y/F)
- The dominant response to this HLA allele was to this epitope for the one reactive HEPS case and in all 8/9 HIV-1 infected women.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.

Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining, Chromium-release assay
Keywords escape, acute/early infection
References Bansal *et al.* 2005

- Patients with acute or early infection were shown to preferentially target variable peptides with higher entropy while those with chronic infection showed responses towards more conserved peptides with lower entropy. In longitudinally followed subjects, responses to variable proteins declined over time while responses to conserved proteins increased. The decline is suggested to be due to CTL escape.
- The response to this peptide was initially low, but increased over time.

Immunogen HIV-1 infection
Species (MHC) human (B53)
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, immunodominance, early-expressed proteins
References Altfeld *et al.* 2006

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognised epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.

- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.

Keywords subtype comparisons, computational epitope prediction, variant cross-recognition or cross-neutralization, vaccine antigen design
References Lazaro *et al.* 2005

- The most common HLA-alleles in the Vietnamese population were found to be HLA-A11, A02, A33, B75, B46, and B62. Several epitopes cluster in short regions in Gag and Nef that are presented by these HLA molecules; these epitopes may be useful targets for vaccine antigens. In a comparison of CRF01_AE sequences to HXB2, 14 mutations were found in epitopes in these Gag and Nef pluriepitopic regions; 7 did not affect the HLA binding score, 3 increased it, and 4 reduced it.
- CRF01_AE variant plCfgwcFkl had a higher HLA-binding score than the HXB2 epitope.

Epitope PLTFGWCYKL
Epitope name A2-PL11(Nef)
Immunogen HIV-1 infection
Species (MHC) human (A2)
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, immunodominance, early-expressed proteins
References Altfeld *et al.* 2006

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognised epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.

Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country China
Assay type CD8 T-cell Elispot - IFNγ
Keywords variant cross-recognition or cross-neutralization
References Zhai *et al.* 2008

- 49 ART-naive chronically HIV-1 infected Chinese subjects' CTLs were tested with 413 OLPs in IFN-gamma assays, determining optimal epitopes specific for Chinese Clade B HIV-1 sequences.
- An inverse correlation was found between CTL response and viral load.
- Targeted peptides have lower entropy than peptides that are not CTL targeted. This correlation is independent of HLA-restriction.

- Author defined epitope PLTFGWCFKL elicited an immune response in Chinese HIV-1 positive subjects as part of peptides QNYTPGPGRFPLTFGWCF and RFPLTFGWCFK-LVPV. This epitope differs from the previously published HLA-A2-restricted epitope PLTFGWCYKL, at 1 residue, PLTFGWCfKL.
- 10 of the 55 HLA-A2 carriers responded to PLTFGWCfKL-containing peptide with average magnitude of CTL response of 192 SFC/million PBMC.

Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A*02)
Country United States
Assay type Intracellular cytokine staining, Other
Keywords rate of progression, escape, immune evasion
References Karlsson *et al.* 2007

- To correlate evolving HIV-1 populations with HLA-A2 restricted immune responses for epitopes in Gag, Pol, Env and Nef, 11 treatment-naive subjects were longitudinally studied. Results show that increased viral load is often associated with broad CTL responses early in infection that persist as an "immunological footprint". Conversely, early, restricted responses may help limit viral load. Phylogenetic and functional evidence of viral escape is seen in Gag, Nef and Pol. Gag and Nef show flanking epitope changes restricted by non-HLA-A2 alleles. As far as modes of viral adaptation, CTL responses were seen to develop both against static viral populations resulting in viral evolution to HLA-A2 as well as against existing mutants resulting in reselection of consensus B-like variants. This study reinforces that CTL immune responses detected are not necessarily beneficial to patients, but may be "footprints" from early effective responses that the virus has since escaped.

Epitope LTFGWCFKL
Immunogen vaccine
Vector/Type: DNA, peptide *Strain:* B clade HXB3 *HIV component:* Nef *Adjuvant:* Complete Freund's Adjuvant (CFA)
Species (MHC) mouse (A*0201)
Keywords binding affinity, computational epitope prediction
References Sandberg *et al.* 2000

- Ten Nef 9-mer peptides were predicted to have a strong binding affinity with HLA-A*0201 – of these, four did bind strongly by a T2 class I stabilization assay, several others bound weakly.
- A CTL immune response to only 3/10 peptides was detected by a 51Cr-release assay after immunization of HLA-A201 transgenic mice with either nef DNA under the control of a CMV promotor, coated on gold particles delivered to abdominal skin by gene gun – LTFGWCFKL did not elicit a CTL response.
- LTFGWCFKL was also tested by subcutaneous injection of Nef peptides in Freund's adjuvant, because it bound strongly to HLA-A*0201, and the peptide vaccination did elicit a response.
- The lack of response to the nef DNA vaccine and the response to the peptide suggests LTFGWCFKL may not be processed.

Assay type Cytokine production, CD8 T-cell Elispot - IFNγ, Chromium-release assay, Other, HLA binding
Keywords vaccine-specific epitope characteristics, cross-presentation by different HLA, HLA associated polymorphism
References Reche *et al.* 2006

- 25 CTL epitopes with sequence conservation were studied. Population protection coverage (PPC) for 5 different ethnic groups in the US was estimated by combining HLA binding predictions and known HLA frequencies. HIV-1-naive individuals mounted a better response to the epitope pools than HIV-1 infected individuals.
- A more detailed evaluation of HIV-naive T-cell responses was undertaken, limiting the study to only those peptides that are restricted to A*0201. Though the peptides could cross-recognize and bind different HLA, they were able to specifically lyse only cells of the same (A*0201) HLA-restriction. Thus, the CTL response was less degenerate than peptide binding to MHC.
- In addition to the published restriction above, epitope LTFG-WCFKL was predicted to be restricted by HLA A*0201.

Assay type CD8 T-cell Elispot - IFNγ
Keywords computational epitope prediction, vaccine-induced epitopes
References Li *et al.* 2006b

- To assess the efficiency of vacine-elicited T-cell responses to epitopes in circulating strains of HIV-1 rather than to consensus or ancestor epitope sequences, the authors used potential T-cell epitopes (PTEs) from Gag, Pol, Nef and Env proteins, to construct an epitope prediction model for peptide selection. Evaluation in their method was conducted by testing Nef-specific CTL responses in four HIV-1 subtype B infected subjects. It was found that peptides autologous to HIV-1 immunogen sequence were the best for vaccine design and that vaccine response evaluation was better performed using peptide sets from circulating strains of HIV-1.
- ENNSLLHPMSLHGMD is a previoulsy unpublished epitope.

Epitope NNCLLHPMSQHGMEDADRE
Subtype C
Immunogen HIV-1 infection
Species (MHC) human
Country South Africa
Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay
Keywords rate of progression
References Gray *et al.* 2009

- 47 HIV-1 subtype C infected patients were followed longitudinally to determine whether there was a relation between magnitude and breadth of CTL responses in primary, acute infection (measured by IFN-gamma ELISpot) and disease progression (measured as viral load at 12 months). CTL responses to Nef were dominant (targeting 6 epitopic regions), followed by responses to Gag, Pol, Rev, Vpr, Env, Vpu, Vif and finally Tat.
- This reactive peptide (1 responder), NNCLLHPMSQHGMEDADRE, is towards the N-terminal of Nef and has no previously described epitope.

CTL CD8+

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, PEKEVLVWKFDSRLAFHH, had an overall frequency of recognition of 15.3% - 22% AA, 11.5% C, 18.2% H, 9.5% WI.

Epitope `EREVLVWKF`
Epitope name EF9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B27)
Country Netherlands
Assay type CD8 T-cell Elispot - IFNγ
Keywords computational epitope prediction
References Schellens *et al.* 2008

- Peptide prediction programs based on MHC binding, proteasomal cleavage and TAP transport were applied to select novel epitopes absent from the Los Alamos HIV database. 22 novel epitopes were tested by IFN-gamma ELISpot and 19 (11 HLA-B27 restricted, 8 HLA-B57 restricted) induced strong positive responses.
- Magnitude of response generated was similar to that of previously identified epitopes, but the number of individuals responding was lower. This could be explained by less stringent HLA-typing of subjects and perhaps high sequence variability within these novel epitopes.
- EF9, EREVLVWKF, is a novel HLA-B27-restricted epitope that elicits a CTL IFN-gamma response significantly lower than Los Alamos database peptides.

Keywords rate of progression, escape, immune evasion
References Karlsson *et al.* 2007

- To correlate evolving HIV-1 populations with HLA-A2 restricted immune responses for epitopes in Gag, Pol, Env and Nef, 11 treatment-naive subjects were longitudinally studied. Results show that increased viral load is often associated with broad CTL responses early in infection that persist as an "immunological footprint". Conversely, early, restricted responses may help limit viral load. Phylogenetic and functional evidence of viral escape is seen in Gag, Nef and Pol. Gag and Nef show flanking epitope changes restricted by non-HLA-A2 alleles. As far as modes of viral adaptation, CTL responses were seen to develop both against static viral populations resulting in viral evolution to HLA-A2 as well as against existing mutants resulting in reselection of consensus B-like variants. This study reinforces that CTL immune responses detected are not necessarily beneficial to patients, but may be "footprints" from early effective responses that the virus has since escaped.
- This epitope, VLEWRFDSRL, was primarily recognized as wild type. Other variants seen were VLEWRFDSsL, VLEWRFgSRL and the 184K emerging variant VLEWkFDSRL. Position 184 fell under 2 overlapping CTL responses restricted by HLAs A2 and B15.

CTL CD8+

- In Table 2, epitope VLvWRFDSRL is printed as the epitope studied. We chose to record the epitope as VLEWRFDSRL seen twice elsewhere in this paper, as it is more commonly annotated as such in the literature.

Epitope VLEWRFDSRL
Immunogen in vitro stimulation or selection
Species (MHC) human (A2)
Keywords binding affinity, dendritic cells, Th1
References Wilson *et al.* 1999b

- Dendritic cells are the most potent for priming T cell responses – DCs can stimulate autologous CTL responses from T cells cultured from HIV negative donors.
- Th1-biasing cytokines IL-12 or IFN alpha enhance CTL responses *in vitro* whether the epitope is delivered by pulsing from peptide, or expressed from within.
- B7 and A2 Nef epitopes were studied and the relative binding affinity of A2 epitopes for A2 was: PLTFGWCYKL greater than VLEWRFDSRL which was much greater than AFHHVAREL.

HXB2 Location Nef (180–189)
Author Location Nef (180–189)
Epitope VLEWRFDSRL
Immunogen vaccine
Vector/Type: DNA prime with vaccinia boost
Species (MHC) human (A2)
References Woodberry *et al.* 1999

- A polyepitope vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2.
- HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D^{d} – this transgene is the only MHC molecule expressed in the mice.
- CTL responses to Gag (77-85) SLYNTVATL, Pol (476-484) ILKEPVHGV, gp120 (120-128) KLTPLCVTL, and Nef (190-198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost.
- No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157-166 (PLTFGWCYKL), Pol 346-354 (VIYQYMDDL), and Nef 180-189 (VLEWRFDSRL)
- Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested.
- VLEWRFDSRL was recognized by 2 of the HLA-A2 patients.

HXB2 Location Nef (180–189)

Keywords rate of progression
References Bailey *et al.* 2008

- This is the first documentation of transmission of HIV-1 from a patient who developed AIDS (Progressor) to an Elite Suppresssor (ES).
- Both patients are HLA-B*5703-positive. The ES also has B*27 allele. Escape mutations in HLA-B*57-restricted epitopes were present in both patients, suggesting that they by themselves cannot explain the difference in the outcomes.
- The study concluded that viral replication is controlled in ES by at least two mechanisms: (i) direct inhibition of viral replication by polyfunctional HIV-1 specific CD8+ T cells that proliferate in response to autologous viral peptides; (ii) selection for and maintenance of escape mutations that have a negative impact on viral fitness.
- This epitope elicited IFN-γ response in the Progressor. Both patients had E182V, K184R, M194V substitutions.

Assay type Intracellular cytokine staining, Other
Keywords rate of progression, escape, immune evasion
References Karlsson *et al.* 2007
- To correlate evolving HIV-1 populations with HLA-A2 restricted immune responses for epitopes in Gag, Pol, Env and Nef, 11 treatment-naive subjects were longitudinally studied. Results show that increased viral load is often associated with broad CTL responses early in infection that persist as an "immunological footprint". Conversely, early, restricted responses may help limit viral load. Phylogenetic and functional evidence of viral escape is seen in Gag, Nef and Pol. Gag and Nef show flanking epitope changes restricted by non-HLA-A2 alleles. As far as modes of viral adaptation, CTL responses were seen to develop both against static viral populations resulting in viral evolution to HLA-A2 as well as against existing mutants resulting in reselection of consensus B-like variants. This study reinforces that CTL immune responses detected are not necessarily beneficial to patients, but may be "footprints" from early effective responses that the virus has since escaped.
- No CTL responses were detected against the WF9 epitope, WRFDSRLAF. A 184K variant, WkFDSRLAF was found, that did elicit a potent HLA-B15 restricted immune response. Sporadic changes were seen in WF9 to WkFDSRLA (R185K).

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Country United Kingdom
Assay type CD8 T-cell Elispot - IFNγ
Keywords responses in children, mother-to-infant transmission, escape, acute/early infection, viral fitness and reversion
References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness.
- Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- DSRLAFHHM is a known A24 epitope. A known escape variant, DSRLAFqHM, was transmitted from an A24- mother to her A24+ infant, where it was gradually lost over time, present in 6/10 clones at 2 months, 7/10 at 4 months, and 0/10 at 15 months.
- Another escape variant was present in an A24+ mother, DStLAFqHk and this form was transmitted to her A24+ infant where it persisted in 30/30 sequences sampled over 12 months.
- DSRLAFHHM had higher responder cell frequencies in the A24+ mother than DStLAFqHk. Her A24+ infant did not recognize either form. The variant DSRLAFqHM also stimulated lower responder cell frequencies.

Author Location Nef (192–200 SF2)
Epitope KLAFHHMAR
Subtype B
Immunogen HIV-1 infection, computer prediction
Species (MHC) human (A*3303)
Assay type Chromium-release assay
Keywords binding affinity, computational epitope prediction
References Hossain *et al.* 2003

- HLA-A*3303 is a common HLA allele in east and southeast Asia. Pol, Gag and Nef SF2 proteins were scanned for potential A*3303 epitopes. 99 potential epitopes were synthesized, and 52/99 bound to A*3303. Six of these served as peptide-targets for lysis by PBMC from infected individuals, and clones derived from 4 of these 6 could lyse HIV-vaccinia infected target cells, indicating proper processing.
- This epitope is one of the 2/6 peptides that could induce CTL responses in the PBMC of infected individuals, but was not properly processed in a vaccinia-HIV infected target cell.

HXB2 Location Nef (188–196)
Author Location Nef (188–196)
Epitope RLAFHHVAR
Immunogen peptide-HLA interaction
Species (MHC) (A11, A3)
Assay type HLA binding
Keywords binding affinity, immunodominance
References Racape *et al.* 2006

- Interaction between purified HLA-A3 molecules and several dominant CD8 epitopes was characterized. Amplitude, stability, and kinetic parameters of the interaction between HLA-A3, peptides, and anti-HLA mAbs were tested.
- Epitopes tested bound strongly to HLA-A3 and formed very stable complexes.
- Gag epitope RLRPGGKKK and Nef epitope RLAFHHVAR complexes with HLA-A3 were not recognized by the A11.1 mAb specific to HLA-A3 alleles. The proposed explanation was that Arg at position P1 of the peptide may push the α2 helix residue and affect mAb recognition.

It was found that peptides autologous to HIV-1 immunogen sequence were the best for vaccine design and that vaccine response evaluation was better performed using peptide sets from circulating strains of HIV-1.
- SLAFHHrARELHPEY is a previously unpublished epitope, that varies from the consensus at the seventh position, arginine.

HXB2 Location Nef (189–198)
Author Location Nef (189–198)
Epitope LAFHHVAREL
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country India
Assay type CD8 T-cell Elispot - IFNγ
Keywords subtype comparisons, computational epitope prediction, immunodominance
References Thakar *et al.* 2005

- PBMCs from HIV-1 infected Indian subjects were tested for HIV-1 Gag (with C clade peptides), Nef (with B clade peptides), and Env (clade B peptides) specific T-cell responses. 5 immunodominant regions conserved across clades were identified in Gag and Nef. 3 antigenic regions were found to be recognized by CTLs in the Indian subjects; these regions were not identified as immunodominant in studies from Africa.
- 26 epitopes were predicted within reactive peptides, of which 90% were clustered in the conserved immunodominant regions of Gag and Nef. 3 of the epitopes were highly conserved across clades, and 7 novel epitopes were found.
- Epitope LAFHHVAREL is predicted to be restricted by HLA-A*6901. It shows some conservation of sequence to Indian subtype C.

HXB2 Location Nef (190–198)
Author Location Nef
Epitope AFHHVAREL
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A*02)
Donor MHC A1, A2, B49, B8, Cw7
Country Germany
Assay type CD8 T-cell Elispot - IFNγ
Keywords immune evasion
References Maurer *et al.* 2008

- The Nef HLA-B8-restricted dominant epitope FL8, FLKEKGGL, was studied both longitudinally over time as well as horizontally in a 56 subject cohort of HIV-1 infected patients to chart FL8 variants. FL8 mutants were associated with higher pVL and lower CD4 cell counts.
- Patient 01 who was studied over time accumulated mutations in AFHHVAREL to AFrHVAREL that later reverted and to AFHHmAREL, concomitant with a strong viremic increase but did not react to this epitope.
- HLA restrictions in this study are previously published and correlate with the subject's HLA.

HXB2 Location Nef (190–198)
Author Location Nef
Epitope AFHHVAREL
Epitope name Nef AL9
Immunogen HIV-1 infection
Species (MHC) human (A*0201)
Keywords subtype comparisons, supertype, computational epitope prediction
References Altfeld *et al.* 2001c

- HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested.
- Three additional previously described HLA-A2 epitopes were added to the set of 20, including Nef AL9, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2)

CTL CD8+

- RT VL9 was not recognized by any of the 22 HLA-A2 patients with chronic HIV-1 infection or the 13 HLA-A2 patients with acute HIV-1 infection included in this study.

HXB2 Location Nef (190–198)
Author Location Nef
Epitope ALKHRAYEL
Subtype A
Immunogen HIV-1 infection, vaccine
Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag
Species (MHC) human, macaque (A*0201)
Keywords subtype comparisons, epitope processing, immunodominance
References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

HXB2 Location Nef (190–198)
Author Location Nef (190–198 LAI)
Epitope AFHHVAREL
Subtype B
Immunogen HIV-1 exposed seronegative
Species (MHC) human (A2)
Keywords subtype comparisons, HIV exposed persistently seronegative (HEPS)
References Rowland-Jones *et al.* 1998a

- CTL recognition reported in the context of HLA-B52 and A2.1, A2.2 and A2.4.
- A CTL response was found in exposed but uninfected prostitutes from Nairobi using previously-defined B clade epitopes that tended to be conserved in A and D clades – such cross-reactivity could protect against both A and D and confer protection in Nairobi where both subtypes are circulating.
- The A subtype consensus is ALKHRAYEL.
- The D subtype consensus is AfEHKAREm.
- Hunziker *et al.* [1998] suggests that HLA-A2 does not in fact present this epitope, and notes that it does not promote A2 assembly Connan *et al.* [1994] – also see Brander *et al.* [1998b]
- Hunziker *et al.* [1998] maintains that HLA-A2 does not present this epitope contrary to an earlier report Hadida *et al.* [1995], (also see Brander *et al.* [1998a])—despite the position of Hunziker *et al.*, Rowland-Jones and colleagues are confident that this epitope in its A clade form is presented by HLA-A*0201 and A*0202, and it is one of the most common responses seen in both seropositive and exposed-uninfected donors from Nairobi (Rupert Kaul, pers. comm.)

HXB2 Location Nef (190–198)
Author Location Nef (190–198)
Epitope AFHHVAREL
Immunogen in vitro stimulation or selection
Species (MHC) human (A2)
Keywords binding affinity, dendritic cells, Th1
References Wilson *et al.* 1999b

- Dendritic cells are the most potent for priming T cell responses – DCs can stimulate autologous CTL responses from T cells cultured from HIV negative donors.
- Th1-biasing cytokines IL-12 or IFN alpha enhance CTL responses *in vitro* whether the epitope is delivered by pulsing from peptide, or expressed from within.
- B7 and A2 Nef epitopes were studied and the relative binding affinity of A2 epitopes for A2 was: PLTFGWCYKL greater than VLEWRFDSRL which was much greater than AFHHVAREL.

HXB2 Location Nef (190–198)
Author Location Nef (190–198)
Epitope AFHHVAREL
Immunogen vaccine
Vector/Type: vaccinia
Species (MHC) human (A2)
References Woodberry *et al.* 1999

- A polyepitope vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2.
- HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D^d – this transgene is the only MHC molecule expressed in the mice.
- CTL responses to Gag (77-85) SLYNTVATL, Pol (476-484) ILKEPVHGV, gp120 (120-128) KLTPLCVTL, and Nef (190-198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost.
- No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157-166 (PLTFGWCYKL), Pol 346-354 (VIYQYMDDL), and Nef 180-189 (VLEWRFDSRL)
- Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested.
- AFHHVAREL was recognized by 2 of the patients.

HXB2 Location Nef (190–198)

Author Location Nef (190–198 SF2)
Epitope AFHHVAREL
Immunogen HIV-1 infection
Species (MHC) human (A2)
Keywords HAART, ART, acute/early infection
References Altfeld *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-A2+ individuals that had a CTL response to this epitope broken down by group: 0/10 group 1, 1/6 group 2, and 0/4 group 3.

HXB2 Location Nef (190–198)
Author Location Nef (190–198)
Epitope ALKHRAYEL
Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (A2)
Keywords subtype comparisons, HIV exposed persistently seronegative (HEPS)
References Kaul *et al.* 2001a

- Variants ALKHRAYEL and AFHHVAREL are A/B clade specific.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.

HXB2 Location Nef (190–198)
Author Location Nef (190–)

Epitope name Nef190
Immunogen HIV-1 infection
Species (MHC) human (A2)
Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric T-cell cytokine assay
Keywords binding affinity, subtype comparisons, computational epitope prediction
References Corbet *et al.* 2003

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This epitope was one of the previously identified HLA-A2 epitopes studied.
- None of the 17 HIV-infected HLA-A2+ people in this study recognized this epitope.

HXB2 Location Nef (190–198)
Author Location Nef (190–198)
Epitope ALHHVAREL
Subtype B
Immunogen vaccine
Vector/Type: lipopeptide *Strain:* B clade LAI *HIV component:* Env, Gag, Nef *Adjuvant:* QS21
Species (MHC) human (A2)
Assay type proliferation, CD8 T-cell Elispot - IFNγ, Chromium-release assay
Keywords vaccine-induced epitopes
References Gahéry-Ségard *et al.* 2003

- After injection of an anti-HIV-1 lipopeptide vaccine and the booster injections, a response was observed in >85% of 28 volunteers, and a long-term immune response was observed in >50% of the volunteers. A positive effect of QS21 adjuvant was found for B-and CD4+T-cell responses. A higher number of CD8+ T-cell epitopes was induced after a fourth boost injection. This epitope was one of 31 that the vaccinated volunteers responded to.

HXB2 Location Nef (190–198)
Author Location Nef (subtype B)
Epitope AFHHVAREL
Subtype B
Immunogen HIV-1 exposed seronegative
Species (MHC) human (A*0201, A*0202, A2)
Keywords subtype comparisons
References Rowland-Jones *et al.* 1998b

- HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi – these CTL may confer protection.
- Seroprevalence in this cohort is 90-95% and their HIV-1 exposure is among the highest in the world.
- Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes.
- Clade A version of the epitope: ALKHRAYEL, Clade D epitope: AFEHKAREM.
- This epitope was recognized by two different exposed and uninfected prostitutes.

HXB2 Location Nef (190–198)
Author Location Nef (190–198)

Immunogen HIV-1 infection
Species (MHC) human (A*0201, Cw*08)
References Shacklett *et al.* 2000

- HIV-1 specific, MHC class I-restricted CTL killing was detected in duodenal and rectal gut associated lymphoid tissue (GALT) sites from three infected individuals – the distribution of class I restricted CTL was different in the peripheral blood samples and GALT samples.

HXB2 Location Nef
Author Location Nef
Epitope
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B*35)
Keywords rate of progression
References Jin *et al.* 2002

- Patients with HLA-B*35 variants B*3502, B*3503, B*3504, and B*5301 tend to proceed to AIDS more quickly than those with B*3501.
- Of 32 patients with HLA-B*35 alleles CD8+ CTL responses were quantified using an intracellular cytokine staining assay – 75% had responses to Pol, 69% to Gag, 50% to Nef, and 41% to Env.
- The overall magnitude of CTL responses did not differ between those bearing B*3501 and the others. A higher percentage of Gag responses was observed in those that had lower RNA levels that carried B*3501, and there was a negative association with viral load and CTL activity. The data is consistent with higher levels of CTL responses contributing to protection in B*3501 individuals, but not in B*3502, B*3503, B*3504, and B*5301 individuals.

Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Keywords epitope processing, escape
References Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found in highly variable regions in Nef, Env, and p17.
- While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated, traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.
- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.

- CTL responses before and after initiation of ART were studied in 13 HIV-1 vertically infected infants <6 months of age, and 4 that were >6 months of age.
- Before ART 2/13 infants <6 months of age showed IFNgamma Elispot CD8+ T-cell responses, one to Nef and one to Env and Nef, and these responses became undetectable after successful therapy– 3 infants were coinfected with CMV and all 3 had CMV-specific CD8+ T-cell responses.
- One older infant, at 23 months, had CTL responses against all for proteins tested, Gag, Pol, Nef and Env, and had the lowest plasma viremia of the study group. 3/4 infants older than 6 months of age responded to either Nef or Pol.
- Administration of ART over 48 weeks broadened the HIV-1-specific CTL response in 2/4 of the older children that were incomplete responders.

HXB2 Location Nef

Epitope
Immunogen HIV-1 infection
Species (MHC) human
Keywords HAART, ART, supervised treatment interruptions (STI)
References Ortiz *et al.* 2001

- Immune responses in eight chronically HIV-1 infected patients undergoing HAART therapy structured treatment interruptions (STI) were studied. STI boosted HIV-1 specific CTL responses and elevated CTL responses were maintained up to 22 weeks after the last treatment interruption, but viral load rebound to pretreatment levels and CD4 T-cell count decline was observed. CD8 responses in PBMC were measured by cytokine flow cytometry with gp160, Gag p55, RT-Pol and Nef expressed in vaccinia.

Assay type Flow cytometric T-cell cytokine assay
Keywords subtype comparisons
References Currier *et al.* 2003

- CD8-cellular immune responses from 21 HIV-1 infected patients from Kenya infected with subtype A, C, D, and unique recombinants were studied for cross-recognition of Gag, Env, and Nef vaccinia-expressed proteins representing subtypes A-H, including CRF01.

CTL CD8+

- Both subtype-specific and cross-reactive CTL were observed, with a skewing of responses towards the infecting subtype in the nine subjects with full length sequence available. The magnitude of the responses to Gag were the highest, less to Nef, and still less to Env.
- For Gag, 8/21 subjects responded to at least 7/8 different subtype proteins, 7 had a mixed response, recognizing some subtypes but not others, and 6 responded to only one or none of the different subtype proteins. For Env, 4/19 subjects responded to at least 7/8 subtypes, 8 had a mixed response, and 7 responded to one or none. For Nef, 5/19 subjects responded to at least 7/8 subtypes, 8 had a mixed response, and 6 responded to one or none.

References Draenert *et al.* 2003

- Six different HIV-1 Nef peptide sets ranging in length from 15-20 amino acids with overlap from 10-11 amino acids derived from either the B clade consensus sequences or the B clade sequence B.AU.AF064676 were used to study the impact of using different peptide design strategies to detect CD4 and CD8 T-cell responses. 20 individuals were tested using the six sets of peptides. 17/20 had CD8 T-cell responses to all peptides sets, and 15 of these 17 had CD4 T-cell responses.
- Although there was a trend in detecting more CD8 T cell responses using the shorter 15-mer peptides, longer 20-mers were best for detecting more CD4 T-cell responses, but neither result was statistically significant. Similar results were seen in the 15 to 20 amino acid range for both IFN gamma Elispot and ICS assays.
- Use of the consensus versus the natural strain identified slightly increased numbers of reactive peptides. Seven reactive peptides were observed with the B consensus peptides but not the B.AU.AF064676 peptides, but on the other hand four reactivites were observed using the B.AU.AF064676 peptides but not the consensus.
- Using an overlap of 10 or 11 amino acids did not make a difference.

CTL CD8+

Keywords HAART, ART, immunodominance, acute/early infection, vaccine antigen design
References Lichterfeld *et al.* 2004b

- HIV-1 specific CD8 T-cell responses in individuals with acute and early HIV-1 infection are preferentially directed against epitopes in the central region of Nef, with 94% of the magnitude of the response in acute infection directed at Nef, and 46% during early infection. In chronic infection, CD8 T-cell immune responses are broadly diversified towards Gag, Env and Pol, and Nef accounts for only 17% of the response.
- The region of Nef that is targeted is the central most conserved region, but relative to other HIV proteins it is still quite variable. However, responses are cross-reactive enough to detect strong acute responses using consensus based peptides, and is an early expressed gene so may have advantages in the context of a vaccine.
- Nef immunodominance was retained in patients that were treated during acute infection, but no treatment and so continuous antigen exposure resulted in rapid diversification of the immune response.

Species (MHC) human (A11, B40, B8, Cw8)
Assay type Cytokine production, CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords HAART, ART, acute/early infection, early treatment
References Alter *et al.* 2003

- Longitudinal study (24 mo) monitoring T-cell immune responses in 4 patient groups: Group 1 (n=6) consists of subjects who underwent HAART preseroconversion, group 2 (n=11) were HAART treated during early postseroconversion, group 3 (n=5) contained patients who started HAART during late postseroconversion, and group 4 (n= 6) commenced with HAART during chronic HIV-1 infection.
- The experimental strategey was to test for reactivity levels with sets of peptides that each contain epitopes with known HLA-restricting elements, making the peptide selection based on the optimal epitope list in this database. The HLA alleles found in the patients were balanced so that the frequency in the groups were comparable. Peptides spanning parts of Gag, Env, Nef, and RT were used for Elispot, and Gag peptides were used for ICS.
- All group 1 patients, and 5/11 group 2 patients, maintained the breadth and the magnitude of the immune response throughout the study; those in group 2 that maintained response started therapy earlier. The hierarchy of intensity of responses to different peptides was preserved. Individuals in groups 3 and 4 all showed a decline, and after treatment lost responses. Groups 1 and 2 showed HAART-induced suppression of viremia but maintained resposnes. Groups 3 and 4 both showed viral suppression in association with a decreased immune response in breadth and magnitude after HAART. The authors suggest that preservation of HIV CD4+ responses can be maintained even if HAART is first given beyond the acute phase of infection, and a delay may allow a full CD8 response to develop while still allowing CD4 function to be preserved.

Keywords TCR usage, characterizing CD8+ T cells, immune dysfunction
References Alter *et al.* 2008

- By studying HIV-1 dysregulation of CTLs at different infection stages induced by inhibitory KIRs (Killer Immunoglobulin-like receptors), it was determined that KIR surface expression on memory T cells correlates with HIV replication. It results in reduced activation, proliferation, cytokine secretion, and killing following TCR stimulation. Since non-TCR-dependent CTL stimulation was unaffected, TCR-mediated stimulation appears to be defective. KIR induced suppression of CTL function was found to be KIR-ligand-independent.
- KF11-specific CTLs had heterogeneous surface expression of KIR. Of these tetramer positive B57-CTLs, only KIR- cells were able to secrete IFN-gamma upon stimulation.

Species (MHC) chimpanzee
Keywords review
References Balla-Jhagjhoorsingh *et al.* 2003

- This paper reviews HIV-1-specific cell-mediated immune responses in chimpanzees and discusses mechanisms that might control HIV-1 pathogenesis in chimpanzees. During the first decade of the HIV epidemic, more than 200 chimpanzees were experimentally infected with HIV. Among these only one case of declining CD4+ cells has been reported, all others have remained asymptomatic with no loss of immune function , some after 20 years of infection. In contrast to infected humans which have a skewed Th2 response, chimpanzees maintain balanced Th responses and are likely to support a fully mature CD8+ T-cell response.
- Specific HIV epitopes recognized by chimpanzees have been mapped and CTL detected , but overall the responses are at much lower levels than in humans, as viral loads are so low. Gag epitope responses are estimated to be 0.0095 to 0.0025% of the CD8+ T cell population in chimpanzee, and 1-2% in humans.
- The authors argue that the chimpanzee immune response may be effective at controlling virus because it focuses on conserved epitopes, and further speculate that long contact with lentiviruses may have put strong selection pressures on the chimpanzee MHC class I, narrowing the population's ability to respond to only the most conserved, and so useful, epitopes.

Immunogen HIV-1 infection
Species (MHC) human
Assay type CD8 T-cell Elispot - IFNγ
Keywords HAART, ART, supervised treatment interruptions (STI)
References Fagard *et al.* 2003

- This study monitored the effects of repeated treatment interruptions (STI), in 2-week intervals, in 133 HIV-1 infected, HAART-treated patients. STIs were rarely able to control viremia without continued HAART, and increases in CD8+ T-cell response frequencies did not correlate with the level of control of viral replication. CD8+ T cell responses were measured by gamma IFN Elispot using between 2-32 different optimal HIV epitopes, selected to be appropriate for the patient's HLA type.

Keywords responses in children
References Feeney *et al.* 2003

- The magnitude and breadth of CD8+ T-cell responses in 18 pediatric (6-17 years) perinatally HIV-1 infected patients was determined using 1) overlapping peptides spanning all HIV-1 proteins and 2) peptides from all predefined appropriately class I HLA-restricted HIV-1 epitopes.
- Perinatally infected children's CD8+ T-cell responses were comparable in magnitude and breadth to adult responses. Many reactive peptides did not overlap with a previously characterized optimal epitope.

- On average 20% of all known pre-defined optimal epitopes presented by appropriate HLAs were recognized in these children. In two patients, autologous sequences spanning unrecognized potential epitopes usually corresponded to the reactive form of the epitope, so epitope variation alone did not account for unrecognized epitopes.
- Children with detectable viremia showed a broader and greater CTL responses than HAART responsive children with undetectable viremia.

Keywords dynamics
References Kousignian *et al.* 2003

- The diversity of HIV protein (Gag, Pol, Env, Nef, Rev, Tat, Vif) recognition by CTLs was studied longitudinally in a cohort of 152 HIV-infected untreated individuals, and was analyzed by Markov modelling. CTL responses from 152 HIV-1 infected patients in four stages of disease progression were collected for a period of 5 years. Results show that memory CTL responses against HIV-1 proteins are acquired during early HIV-1 infection and subsequently lost. As viral load increased there was an accelerating loss of multiple protein recognition.

Keywords review, class I down-regulation by Nef, early-expressed proteins, immune evasion
References Collins 2004

- There are a number of factors that combined make HIV-infected cells resistant to CTLs. HLA-associations with disease progression are reviewed. Nef down-regulation of HLA class I A and B molecules is one important mechanism of HIV immune evasion. Rev allows late viral proteins to be expressed, enabling CTL specific for epitopes in these proteins to recognize infected cells. It is suggested that blocking the activity of Nef and Rev would reduce production of viral variants and enhance the ability of CTLs to combat HIV.

References Russell *et al.* 2003

- IFN-γ Elispot assay is shown to be a good initial screening method for measurment of CD8+ T-cell responses in both vaccination and natural HIV-1 infection. Responses were detected using peptides at low concentrations (1-2 µg/mL) and an increase in detection of HIV-1 specific CD8+T-cells by using 15-mers rather than 20-mer peptides for cell activation was observed. More responses were detected using smaller pools (10 or 2 peptides) than larger pools (25 or 50 peptides), so smaller pools may be needed to detect low frequency responses. Responses to natural infection were more than a log higher than to the vaccine.

References Gamberg *et al.* 2004b

- A relationship was found between the proportion of HIV-specific CTLs expressing CD28 and CD4+ T-cell counts, viral load and disease progression. This association cannot be linked to disease related degeneration of CD8+CD28- T-cells in terms of their TCRbetaV family repertoire diversity or ability to produce cytokines. This suggests that effective immune responses contain CD8+CD28+ T-cell populations that shift to CD8+CD28- in ineffective responses.

- CTLs have a central role in the control of HIV infection. Emergence of escape variants to CTLs is one of the major obstacles to vaccine development. Factors that should be considered for the development of an HIV vaccine are CTLs that are specific for epitopes recognized during the acute phase of infection, CTLs that are able to efficiently control viral replication, and epitopes from regions of the viral genome that are highly conserved or where variation results in loss of viral fitness.

Keywords HAART, ART, characterizing CD8+ T cells, immune dysfunction
References Kryworuchko *et al.* 2004

- A subset of HIV-1 infected untreated patients had CD8+ T-cells that were unable to respond to IL-2 by activating STAT5a and b proteins. This was correlated with an impaired activation of the upstream kinase Jak-3. 6 months of HAART was shown to restore Jak/STAT signalling in those patients and their CD8+ T-cell response to IL-2. This suggests another mechanism for immune dysfunction in HIV infected patients.

Keywords review, epitope processing, rate of progression, escape, early-expressed proteins, vaccine antigen design
References Yang 2004

- This review considers CTL biology in HIV infection in the context of vaccine design principles. Since HIV-1 infection damages immunity through depletion of CD4+ T-cells, which in turn results in diminished capacity of the immune system to produce new and functional CTL responses, maximizing the breadth of CTL responses might not be enough for an HIV-1 vaccine. CTLs recognizing early proteins might be more prone to epitope escape mutation, while those recognizing more conserved structural proteins might be more likely to persist, so focusing on more conserved proteins those might be a good strategy to produce an attenuating vaccine.
- Original antigenic sin is discussed, the initial responses to an antigen that persist even after escape occurs, blunting the later immune response. If the goal is to prevent disease, focusing on conserved late expressed proteins might be the best target, where the fitness cost is greatest for escape; if the goal is to prevent infection, focusing the vaccine on the more variable early expressed proteins that elicit the first responses, Tat and Nef, might be best.

- This study describes a novel approach to achieve maximal information from an extensive set of antigens (HIV, EBV, CMV, HCV, and HBV) to determine the magnitude of T-cell responses while requiring minimal cell numbers. Large sets of peptides based on optimally defined epitopes from each pathogen are used. It is shown that, when compared to ex vivo cell preparations, antigen-unspecific in vitro T-cell expansion maintains the breadth of detectable T-cell responses. Also, harvesting cells from negative ELISpot wells for re-use (RecycleSpot) maximizes the use of available cells.

- The breadth and magnitude of HIV-1-specific CTL responses in blood and sigmoid colon mucosa were assessed in 16 patients. The magnitude of pool-specific CTL responses in blood and mucosa was correlated within each individual and across all individuals. CTL targeting was also found to correlate between these 2 compartments, with Nef being the most highly targeted region, followed by Gag. No correlation between the magnitude and breadth of CTL responses and viremia and blood CD4 levels was found in any of the compartments. Concordant peptide pool responses were found in the blood and mucosa 85%; pools that differed were near the threshold of detection.
- This study suggests that HIV-1-specific CTL responses in the blood mirror those in the mucosa during chronic infection.

- Mice were given intranasal immunization with inactivated gp120-depleted HIV-1 antigen plus a CpG ODN adjuvant and examined for local immune responses in the genital tract. Mice immunized with HIV Ag plus CpG produced significantly higher levels of IFN-gamma and beta-chemokines than mice immunized with Ag alone, and their lymphocytes showed significant HIV-specific proliferation. CD8 T-cells were increased in the genital tracts of mice immunized with HIV Ag plus CpG.
- The vaccine antigen Z321 is clade G in Gag. Cross-clade protection against an intravaginal challenge was observed for clades A, C, and G, but not clade B.

- HIV-specific T-cell responses to peptide from A, B, and C clade spanning the entire HIV proteome were assessed in clade B infected individuals. Many cross-reactive responses were observed against clade A, B, and C consensus sequences, preferentially recognized in conserved regions with low intra-clade diversity and high inter-clade homology.
- At the individual peptide level, within clade responses to B clade peptides were more frequent. 194 responses were detected with only one peptide, of these 105 recognized B clade, 55 C clade , and 34 A clade. 125 responses recognized peptides from two clades, and 110 of these were with B plus either A or C. 166 responses were cross-reactive with all three clades.

References Ganusov & De Boer 2006

- A simple mathematical model is used to estimate costs of CTL escape mutations and killing rate of CTLs. Using in vivo data, it is shown that minimal estimates of the fitness cost of the escape mutations and minimal estimates of the average killing rate can be obtained. This general model may be used for both acute and chronic phases of SIV/HIV infection.
- Fitness cost is found to be proportional to the rate of replacement of the mutant by wild-type rather than the time taken for this to happen. Exponential growth of the virus is assumed during such reversion experiments. However, no virus growth is assumed during escape experiments to gauge the minimum average rate at which the CTL response clears one viral epitope.

References Frahm & Brander 2007

- This report characterizes HIV epitope variants with a view to guiding vaccine design. It discusses immune correlates of controlled HIV infection, HIV escape from cellular immunity and the effects of sequence diversity on T-cell recognition.
- In controlled infections it is noted that diversity of HIV-specific cells is associated with better control of infection than magnitude of HIV-specific response. The specific epitopic region targeted by host immune cells is a determinant in controlling infection too. However, high avidity responses are effective in virus control and epitope recognition despite a limited T-cell receptor repertoire. While HLA-B alleles mediate most CTL cellular immunity, subdominant responses are key in effective immune control. On the other hand, uncontrolled virus replication is linked to high expression of PD-1, low IL-7R, fewer early and intermediate differentiated cells, absence of CD4 T-cell help and reduced proliferation.
- HIV escape can occur on several fronts - viruses may develop compensatory changes to restore fitness; transmission between individuals with different HLA types allows virus reversion; certain epitopes may disappear from circulating viral populations if there is a high population frequency of specific HLA and specific epitope variants can even act as antagonists or partial agonists either silencing total epitopic T-cell responses or inducing immune responses even with only partial functionality.
- Sequence diversity is greatly increased by the spread of unique recombinant forms of HIV in individuals. The authors advise the use of detailed single-peptied-based analyses in addition to using peptide pools. They also suggest 3 approaches to incorporating sequence diversity in vaccine studies.

- To address the role of reversions in early HIV-1 evolution, the authors studied 7 acute infected AIDS patients longitudinally. Their findings show that most forward mutations in HIV-1 were significantly likely to occur within and including "neighboring" CTL epitope residues restricted by the host's HLA type. 62% of early/fast mutations arising within 6 months of infection were reversions to consensus sequences while 73% of forward mutations occurred as late/slow mutations. Almost 30% of reversions were found in CTL epitopes not restricted by the current host. Reversions themselves occurred faster in conserved residues as well as more conserved proteins like

Gag and Pol; however slow reversions were seen more frequently in Env and non-structural proteins like Vif, Tat and Nef. The authors suggest that fitness cost and structural constraints may be the underlying cause for high and early reversion rates.

- By using a method developed recently [Asquith et al., PLOS Biology. Vol:4, Issue: 4. pp. 583-592 (2006)] for estimating the in vivo rate at which CTLs kill HIV-1-productively infected cells, the authors compare previously determined human CTL control of HIV-1 infection with macaque CTL control of SHIV/SIV infection. Quantitatively, it was shown that macaque CTLs kill infected cells significantly faster than human. Also, in most cases for both species, the outgrowth of escape variants was too rapid to put anything but a lower bound on the escape rate. There was also no significant difference in virus escape rate between macaque chronic or acute infection.
- Inspite of the fact that CTL response in macaques is faster than in humans, CTL-induced viral escape variants appeared more rapidly in macaques than in humans. However, macaque escape variants also had a higher fitness cost, as evidenced by their higher rate of reversion upon transfer of viral variant to macaques that did not present the HLA restricting the epitope under study. Taken together, it was determined that immunodeficient virus-infected cells were killed almost 10 times more rapidly in macaques than in humans.

- To evaluate the immunogenicity of various vaccine modalities the IFN-gamma ELISpot assay is optimized and validated here across vaccine recipients and regimens, using 9-, 15- or 20-mer peptide pools. An empirical method to establish positivity criteria with a <1% false-positive rate was established at >=55 spots/10^6 PBMCs and >=4-fold over mock negative control. Moreover, 15-mer peptides had greater sensitivity than 20-mers as well as a greater specificity; i.e. ability to stimulate CD4 and CD8 T cells with fewer false-positives and cross-reactive responses, than 9-mers.

- Using IFN-gamma ELISpot analyses and peptide pools, the authors studied a cohort of 54 chronically infected HIV-positive individuals to evaluate CTL responses against HIV-1. 2 criteria were established to score an ELISpot as positive - a reading of > 55 SFC/10^6 PBMC and an antigen response at least 4-fold higher than that of mock antigen. By performing T subset depletion the contribution of CTL responses to cellular immunity was proven. These CTL immune responses were mounted mostly against Gag, Pol and Nef peptide pools, and to a lower extent versus Rev and Tat peptides. Without antiviral therapy, host CTL responses correlate directly with plasma viral loads during chronic infection.

- This correspondence is in response to an article by Arien et al. (2007) Nature Reviews Microbiology 5(2):141-51. Here the authors claim that in silico studies demonstrate HIV follows "survival of the flattest" effects. They propose that HIV-1 shifts to robust population characters that protect it from niche perturbations and increase its survival at the expense of replicative fitness. The balance between intra-host replication and inter-host transmission is suggested to be held by circulating viruses going from high fitness and low mutational support to lower fitness and high mutations. They maintain that lower fitness does not equal virus attenuation as discussed by Arien et al.

- To sidestep the issue that in vaccine design against AIDS, providing protection against global diversity may be an insurmountable problem, a prototype conserved elements (CE) vaccine comprising 45 8-residue long HIV segments is described. Therefore the authors seek to cope with HIV-1 diversity by avoiding it altogether. Stringent conservation criteria are followed to find CEs devoid of mutable segments across M group viral proteomes. Most CE were identified in Pol, Gag, Env, Vif and Rev.
- Even though most CE peptides were identified in Pol, these are rarely targeted in natural infections probably because of the much lower ratio of Pol proteins produced compared to Gag. Therefore Pol CE were used here in contrast to most other vaccines.
- Nef was not used and fewer Env CE peptides were used in this vaccine, even though they are usually found in other vaccines.
- Many CE segments contained known CTL epitopes and are implicated with LTNPs. One crucial advantage of this strategy is that a single global CE vaccine should work against all circulating HIV-1 M strains.

- In this letter "quality" over "quantity" of cellular immune response is reviewed as the key to controlling viral replication. Responses to Gag protein are the only significant immunity in both HIV-1 and -2 (in particular a 15 residue peptide in HIV-2 Gag). Reasons cited are the great fitness cost for Gag escape mutations and early post-infection Gag processing, that gives gag-specific CTL an early advantage in controlling viral replication.
- Other aspects of CTL "quality" mentioned are polyfunctionality, high avidity and replacement of exhausted T cells with new clones. Varying selection pressures between HIV-1 genes, viral founder effects versus actual T-cell selection pressure and mechanisms of antibody anti-viral activity are new discoveries to be considered in vaccine studies.

Keywords review, immunodominance, escape, immune evasion, viral fitness and reversion, compensatory mutation
References Allen & Altfeld 2008

- This commentary on Goepfert et al. J. Exp. Med. 205:1009-17 (2008) and other papers discusses the efficacy of HIV-1 control by immune response-driven mutations in the conserved region of Gag.
- As with drug-induced selection pressure, CTL-induced pressures for epitopes like Gag-TW10 (TSTLQEQIAW) in HLA-B57 patients result in immune escape. Viral load, however, remains controlled by reduced replicative fitness as suggested by reduced replication in vitro; rapid reversion upon transmission to B57- hosts; secondary partially restoring compensatory mutations; and an inverse correlation between number of epitope mutations and viral load.

- Transmitted Gag but not Nef accumulated mutations associate with reduced viral load, especially for HLA-B restricted epitopes.
- Immune selection history within the highly conserved 100-amino acid stretch of Gag is most indicative of early, sustained viral control in both HIV-1 and SIV, as well as in HLA-B57 and -27 hosts.
- The higher the number of sequence variations in Gag, the greater viral control.
- The commentary concludes that to reduce and avoid competition between virus-specific CTLs generated against different epitopes, variable regions of Gag should be excluded from vaccine constructs.

Epitope
Immunogen computer prediction
Species (MHC) human
Assay type Other
Keywords escape
References Althaus & De Boer 2008

- A computational model of HIV/SIV infection follows immune escape dynamics longitudinally. Several CTL clones recognizing epitopes are used in this model. Escape may be early during acute infection or late and can be sequential too. Early escapes arise rapidly, mostly from immunodominant clones. Escapes could be selected later despite their presence early in virus populations as sub-dominant clones increase.
- Low escape rates do not necessarily mean low killing rates. Escape rates decelerate due to fitness costs for replication. Also, if killing follows Michaelis-Menten rather than mass action kinetics, escape rates lower.
- Immunodominant clones induce strong selection pressure to escape, which though it results in increased numbers of infected cells, also reduces viral replicative capacity.

- Peptides from 3 computationally designed centralized sequences (consensus, ancestor and center-of-tree (COT)) of HIV clades B,C and group M were compared for their ability to be targeted in gamma-interferon ELISPot detection assays. Consensus sets used were ConB'01, ConB'02, ConC and ConM; ancestral were AncB and AncM; and COT, COTB and COTM. No one peptide set was a more sensitive detector, but combination of the sets were significantly more potent at CTL response detection.
- Genetic distance between local patient HIV sequence and peptide test set was inversely related to response rate. Inter-clade C peptide sets were more robust detectors of C-clade infection than intra-clade (B); however group M peptide responses were comparable to within-clade C ones. Thus for HIV-C infections, combining group M, all clade B and clade C sets was significantly better than detection by ConC alone. This was not true of Clade-B intra-clade responses.

- This opinion article discusses CTL failure and suggests HIV vaccine antigens. Early immunodominance against variable epitopes; and CTL mis-targeting leading to escaping immunodominant epitopes, 'original antigenic sin', depletion of CD4+ T cells that aid memory and long term T-cell function, abnormal CTL activation and differentiation are reasons for multifactorial CTL failure in chronic infection.
- Subverting immunodominance against poorly conserved epitopes could interrupt events causing CTL failure. Suggested viral sequences for vaccine inclusion are (i) epitopes from relatively conserved regions less prone to escape, (ii) administered before natural infection, in order to set CTL memory to avoid immunodominance. This, however, would diminish breadth of response as well as cross-clade immunogenecity.

- The study describes and tests an optimized method for configuration of peptide pool matrices encompassing hundreds of overlapping peptides and the method of epitope deconvolution.
- 4 matrices of pools of peptides (15-mers overlapping by 11) were constructed and tested in 3 HIV-positive individuals.
- It was found that the peptide configuration requiring the least amount of blood sample depends on the predicted number of positive peptides in the set.
- In the 3 patients tested, 74 reactive peptides were identified altogether, with minimum 53 potential epitopes taking overlaps into account. Many of the peptides have been previously identified as CTL or helper epitopes.

HXB2 Location HIV-1
Author Location
Epitope
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country Jamaica
Assay type CD8 T-cell Elispot - IFNγ, CD4 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords responses in children
References Huang *et al.* 2008a

- CD8+ and CD4+ T cell responses were studied in 76 pediatric patients using overlapping peptides spanning B clade consensus.
- T cell responses were present in the majority of infected infants, but there was a gualitative difference in responses in young infants and older children.
- Targeting of Gag was associated with significantly lower plasma HIV-1 RNA levels, but Gag-specific responses were less commonly detected in infants than in children older than 12 months. CD8 T cells exhibiting multiple effector functions (IFN-γ, TNF-α and degranulation) were detected less frequently in younger infants. CD4 T cell responses were of very low magnitude in nearly all pediatric patients and absent in the youngest infants.

Part III

HIV Helper/CD4+ T-Cell Epitopes

III-A

Summary

This part includes tables, maps, and associated references of HIV-specific helper T-cell (Th) epitopes from the literature arranged sequentially according to the location of the proteins in the HIV-1 genome. We attempted to make this part as comprehensive as possible, requiring that the epitope be contained within a defined region of a maximum of 30 amino acids, but not that the optimal boundaries be defined. Studies that were based on the analysis of whole proteins are described at the end of each protein section. The same epitope can have multiple entries, as each entry represents a single publication in this part of the database. HLA specificity is usually not determined for Th epitopes. For more recent updates, epitope sequence alignments, and useful search capabilities, please see our web site: `http://www.hiv.lanl.gov/content/immunology`. Helper T-cell responses to proteins with no defined epitopes are listed at the end of each protein section.

Recent studies utilize multiple functions attributed to T cells to define responses, and the simple distinctions of cytotoxic T cells and helper T cells have become blurred as more is learned about the range of responses triggered in CD4 and CD8 positive T cells responding to antigenic stimulus. When adding the most recent studies to the database, we have tried to place T cell responses in a reasonable manner into our traditional helper T cell and CTL parts, and to specify the assay used to measure the response in each study.

III-A-1 Epitope tables

Each T-helper epitope has a multi-part basic entry:

HXB2 location: The viral strain HXB2 (GenBank Accession Number K03455) is used as a reference strain throughout this publication. The position of the defined epitope location relative to the sequence of the HXB2 protein is indicated. The numbering in this table corresponds to the protein maps. Because of HIV-1 variation the epitope may not actually be present in HXB2; rather, the position in HXB2 indicates the position aligned to the epitope. HXB2 was selected as the reference strain because so many studies use HXB2, and because crystal structures for HXB2-related proteins are often available. The precise positions of an epitope on the HXB2 reference strain can be readily obtained using the interactive position locator at our web site: `http://www.hiv.lanl.gov/content/sequence/LOCATE/locate.html`.

Author location: The amino acid positions of the epitope boundaries and the reference sequence are listed as given in the primary publication. Frequently, these positions as published are imprecise, and do not truly correspond to the numbering of the sequence, but they provide a reasonable guide to the peptide's approximate location in the protein. Also, in many cases the reference sequence identification was not provided, and in such cases it is not possible to use these numbers to specify precise locations.

Epitope: The amino acid sequence of the epitope of interest as defined in the reference, based on the reference strain used in the study defining the epitope. On occasions when only the position numbers and not the actual peptide sequence were specified in the original publication, we tried to fill in the peptide sequence based on the position numbers and reference strain. If the sequences were numbered inaccurately by the primary authors, or if we made a mistake in this process, we may have misrepresented the binding site's amino acid sequence. Because of this uncertainty, epitopes that were not explicitly written in the primary publication, that we determined by looking up the reference strain and the numbered location, are followed by a question mark in the table.

Epitope name: If the epitope has a name attributed by the publication, it is recorded here, e.g. "SL9".

Subtype: The subtype under study, if specified in the primary publication; this is generally not specified for B subtype.

Immunogen: The antigenic stimulus of the Th response. Often this is an HIV-1 infection. If a vaccine was used as the original antigenic stimulation, not a natural infection, this is noted separately, and additional information about the vaccine antigen is provided as available.

Species (MHC): The species responding and MHC or HLA specificity of the epitope.

Donor MHC: The HLA genotype of the individual that responded to the epitope.

Country: The country where the samples were obtained; this is generally not specified if the study was conducted in the United States.

Assay type: Assay used to characterize the response.

Keywords: Keywords are a searchable field for the web interface that is included in the T-cell sections of the printed version to help identify entries of particular interest.

Reference: The primary reference (sometimes two or more directly related studies are included). Details for some of the earlier references are in Part V.

Following the entry for a given Th epitope brief comments explain the context in which the epitope was studied and what was learned about the epitope in a given study.

III-A-2 HIV protein epitope maps

All HIV Th epitopes mapped to within a region of 18 amino acids or less are indicated on the HIV protein epitope maps. The location and HLA restriction elements of Th epitopes are indicated on protein sequences of HXB2. These maps are meant to provide the relative location of defined epitopes on a given protein, but the HXB2 sequence may not actually carry the epitope of interest, as it may vary relative to the sequence for which the epitope was defined. Epitopes with identical boundaries and HLA fields are included in the maps only once. If one laboratory determines HLA presenting molecules at the serotype level (example: A2) and another at the genotype level (example: A*0201) both will be included in the map. MHC specificities are indicative of the host species; when no MHC presenting molecule is defined, the host species is noted.

III-A-3 Alignments

To conserve space, no epitope alignments are provided in this book, but they can be generated using the Th epitope search tool at `http://www.hiv.lanl.gov/content/immunology`. The master alignment files from which the epitope alignments were created are available at our web site at `http://www.hiv.lanl.gov/content/sequence/NEWALIGN/align.html`.

III-B

HIV Helper/CD4 + T-Cell Epitope Tables

All HIV Helper/CD4+ T-Cell epitopes are arranged by protein position. The table entries are sorted in a nested way—first by protein, then by HXB2 start location within the protein, and finally by HLA presenting molecule. Epitopes for which the HXB2 location is unknown appear at the end of the listing of the protein in which they are located.

III-B-1 Gag p17 Helper/CD4 + T-cell epitopes

HXB2 Location p17 (1–18)
Author Location p17 (1–18 B consensus)
Epitope MGARASVLSGGELDRWEK
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country United States
Assay type CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining, HLA binding
Keywords supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection
References Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN-γ EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This epitope was recognized by 14% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNPs responded to many peptides, comparable to acute STI.

HXB2 Location p17 (5–16)
Author Location Gag (5–15)
Epitope ASILRGGKLDKW
Subtype C
Immunogen HIV-1 infection
Species (MHC) human
Country India
Assay type CD4 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords subtype comparisons
References Kaushik *et al.* 2005

- T cell responses to Gag consensus C peptides were studied in C-infected patients from India. CD8+ responses were stronger and broader than CD4+ responses. IFN-γ response was higher in both CD8+ and CD4+ T cells than corresponding IL-2 response, that was detectable only in CD4+ T cells.
- 1/25 patients responded to this peptide (IFN-γ CD4+ response). IL-2 response was not detectable.

HXB2 Location p17 (7–17)
Author Location Gag (7–17)
Epitope VLSGGELDRWE
Epitope name Gag 1.2
Immunogen vaccine
Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* B clade *HIV component:* Env, Gag, Protease, Rev, RT, Tat, Vpu
Species (MHC) macaque
Assay type T-cell Elispot, Intracellular cytokine staining
Keywords subtype comparisons, memory cells
References Amara *et al.* 2005

- Clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02_AG consensus Gag in macaques. The activity was better-conserved for CD8 than CD4 T cells.
- 3/5 CD8 epitopes and 2/8 CD4 epitopes were conserved across multiple HIV-1 clades. All 5 CD8, and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation. VLSGGELDRWE was not reported for human infections.
- The response elicited to the B clade epitope VLSGGELDRWE does not cross-react with the CRF02_AG form VLtGGELDsWE. The forms VLSGG[e/k]LD[r/ak]WE are prevalent among M group clades.

Assay type CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining, HLA binding

T-Helper CD4 +

Keywords supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection
References Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN-γ EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 22% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNPs responded to many peptides, comparable to acute STI.

Keywords HAART, ART, Th1, Th2
References Lotti *et al.* 2002

- 10/49 chronically HIV-1 infected patients had low p55-Gag-specific CD4+ T cell responses prior to therapy, and these responses remained unchanged 3 and 6 months after initiation of HAART. There was no difference in level of response in those with or without a detectable p55 response.
- For one individual, patient F45 CDC stage A2, CD4+ p55 responding clones were generated. Her response was consistently strong and heterogeneous in terms of HLA restriction and Vβ usage, and some clones had a Th1 cytokine secretion profile (high IFNgamma production) while some had a Th2 profile (high IL-4 and IL-5 production). 5/10 CD4+ clones could also induce cytotoxicity.
- 4/10 clones from patient F45 had their epitopes mapped using overlapping peptides. Clone 6 recognized this peptide sequence restricted by DRB1*13. This clone had a high SI (27.1 to p55, 90.6 to peptide) secreted IFNgamma, indicative of a Th1 response, as well as TNFalpha. Clone 6 was highly cytotoxic, through a perforin-mediated pathway.

HXB2 Location p17 (20–30)

Immunogen HIV-1 infection
Species (MHC) human
Country India
Assay type CD4 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords subtype comparisons
References Kaushik *et al.* 2005

- T cell responses to Gag consensus C peptides were studied in C-infected patients from India. CD8+ responses were stronger and broader than CD4+ responses. IFN-γ response was higher in both CD8+ and CD4+ T cells than corresponding IL-2 response, that was detectable only in CD4+ T cells.
- 1/25 patients responded to this peptide (IFN-γ CD4+ response). IL-2 response was detectable.

HXB2 Location p17 (21–35)
Author Location p17 (21–35 SF2)
Epitope LRPGGKKKYKLKHIV
Immunogen HIV-1 infection
Species (MHC) human (DR13.02)
Keywords escape
References Harcourt *et al.* 1998

- 43 asymptomatic HIV+ individuals were screened for proliferative responses to HIV – 12 showed a response, and dominant epitopes were mapped for two individuals, one in p24 and one in p17.
- Patient 024's naturally occurring variant LRPGGKKKYQLKHIV also elicited a strong proliferative response.
- Naturally occurring variants of this epitope were found within the individual who made this response – several did not stimulate the CD4+ T-cell line that recognized the index peptide, suggestive of immune escape.

HXB2 Location p17 (21–35)
Author Location p17 (21–35)
Epitope LRPGGKKKYKLKHIV
Immunogen vaccine
Vector/Type: DNA, virus-like particle (VLP), HIV infected-cell lysate, polyepitope *HIV component:* Env, Gag, Nef, Pol
Species (MHC) human (DR13.02)
Country Russia
Assay type T-cell Elispot
Keywords vaccine antigen design
References Bazhan *et al.* 2008

- Two immunogens were combined in the CombiHIV vac (VLP-TBI-pcDNATCI) vaccine: artificial polyepitope protein TBI, containing T- and B-cell epitopes from Env and Gag and the DNA vaccine construct pcDNA-TCI, carrying CTL and CD4+ epitopes from Env, Gag, Pol, Nef.
- Combination of two B- and T-cell immunogens resulted in increase in the antibody response (but not CTL response) to both TBI protein and the proteins from HIV-1 lysate, compared to the level of antibodies induced by immunization with either immunogen alone. The synergistic effect in the induction of B-cell-mediated response was explained by the presence of CD4+ T-helper epitopes in TCI, due to stimulation of B-cell proliferation and differentiation.

T-Helper CD4+

- LRPGGKKKYKLKHIV is a previously known epitope that is a part of TCI fragment KIRLRPGGKKKYKLKHIVWAS-RELERFAVN in this vaccine construct.

Keywords subtype comparisons
References Kaushik *et al.* 2005

- T cell responses to Gag consensus C peptides were studied in C-infected patients from India. CD8+ responses were stronger and broader than CD4+ responses. IFN-γ response was higher in both CD8+ and CD4+ T cells than corresponding IL-2 response, that was detectable only in CD4+ T cells.
- 1/25 patients responded to this peptide (IFN-γ CD4+ response). IL-2 response was not detectable.

Immunogen HIV-1 infection
Species (MHC) human
Country United States
Assay type CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining, HLA binding
Keywords supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection
References Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN-γ EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 11% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNPs responded to many peptides, comparable to acute STI.

Species (MHC) macaque
Assay type T-cell Elispot, Intracellular cytokine staining
Keywords subtype comparisons, memory cells
References Amara *et al.* 2005

- Clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02_AG consensus Gag in macaques. The activity was better-conserved for CD8 than CD4 T cells.
- 3/5 CD8 epitopes and 2/8 CD4 epitopes were conserved across multiple HIV-1 clades. All 5 CD8, and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation.
- EELRSLYNTVA was not reported for human infections.
- The response elicited to the B clade epitope EELRSLYNTVA does not cross-react with the CRF02_AG form EEfkSLYNiVA. The epitope is however conserved across clades A,B,C,D,F.

Keywords HAART, ART
References Boritz *et al.* 2003

- HIV infected individuals with advanced disease often have only weak or undetectable HIV specific Th responses, and HAART can sometimes restore Th HIV recognition in such cases. The repertoire of Th responses to p24 in an individual who responded to HAART after having a CD4+ T-cell count of 0 cells ul was determined. Eleven clonotypes were found among 13 clones, recognizing eight distinct epitopes, with a range of MHC affinities and functional avidities. Multiple Gag p24 peptides were also recognized using CD4 Elispot assays based on samples from six additional HAART-treated CD4 T-cell-reconstituted subjects.
- The TCR that recognized this epitope used Vβ5.1.

T-Helper CD4+

References Boaz *et al.* 2003

- Proliferative and cytokine (IFNgamma and Il-2) immune responses to 11 previously defined (Wilson 2001), and immunodominant and broadly cross-reactive Th epitopes and to p24 overlapping peptides were characterized in 10 LTNPs (chronically infected, asymptomatic, long term non-progressors, CD4+ T cells >500 after 15 years) and 7 SPs (slow progressors, CD4+ T cell declined to <500 after 15 years. Patients were treatment-naive.
- Gag-specific CD4+ T cells in LTNPs showed increased numbers of IFN gamma and IL-2 producing cells compared to SPs. Cytokine production and proliferative responses were negatively correlated with the viral load and positively correlated with the CD4+ T cell count. IL-2, but not IFNgamma, levels were correlated with proliferation.
- Gag1 was 1 of 3 peptides that had a negative correlation between absolute number of responding cells and viral load.

Species (MHC) mouse (DR, I-A^{b})
Donor MHC H-2b
Keywords vaccine-specific epitope characteristics, immunodominance
References Livingston *et al.* 2002

- 4 Th HIV epitopes presented by HLA-DR molecules were identified that also could be presented by murine class II molecule I-Ab, enabling testing of vaccine strategies in H-2b mice.
- Responses to pooled peptides, polyepitope peptides in a linear construct or in a branched MAP construct, and a DNA polyepitope construct with a CMV promoter were compared. A linear arrangement in polyepitope construct created a junctional epitope that could be disrupted with the addition of GPGPG spacers. The linear polyepitope construct with the GPGPG spacer worked well in terms of eliciting responses to all 4 peptides, using either DNA or protein for the vaccination.

Epitope `KVVEEKAFSPEVIPM`
Epitope name G040
Immunogen HIV-1 infection
Species (MHC) human
Country Canada
Assay type proliferation, Flow cytometric T-cell cytokine assay
Keywords memory cells
References Younes *et al.* 2003

- HIV-1-specific CD4+ T-cell responses were analyzed for 6 years since primary infection, in 10 aviremic and 8 viremic patients.
- CD4+ T cells proliferating responses were correlated with the frequency of CD4+ T cells secreting IL-2 in aviremic patients. In viremic patients, CD4+ T cell proliferative response was impaired despite of the high frequencies of IFN-γ, but not IL-2-producing CD4+ T cells in periods of elevated viremia, suggesting that long-term CD4+ memory depends on IL-2-producing CD4+ T cells and that IFN-γ only-producing cells are short lived.

HXB2 Location p24 (28–36)
Author Location p24 (160–168 HXB2)
Epitope `EEKAFSPEV`
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (DRB1*0101)
Donor MHC DQ1, DQ5, DR51, DRB1*0101, DRB1*1501
Assay type proliferation, T-cell Elispot, Intracellular cytokine staining
Keywords HAART, ART
References Boritz *et al.* 2003

- HIV infected individuals with advanced disease often have only weak or undetectable HIV specific Th responses, and HAART can sometimes restore Th HIV recognition in such cases. The repertoire of Th responses to p24 in an individual who responded to HAART after having a CD4+ T-cell count of 0 cells ul was determined. Eleven clonotypes were found among 13 clones, recognizing eight distinct epitopes, with a range of MHC affinities and functional avidities. Multiple Gag p24 peptides were also recognized using CD4 Elispot assays based on samples from six additional HAART-treated CD4 T-cell-reconstituted subjects.
- The TCR that recognized this epitope used Vβ2.

HXB2 Location p24 (28–38)
Author Location p24 (HXB2)
Epitope `EEKAFSPEVIP`
Subtype B
Immunogen in vitro stimulation or selection
Species (MHC) human (DQ5)
Assay type CD4 T-cell Elispot - IFNγ
Keywords epitope processing, vaccine antigen design
References SenGupta *et al.* 2004

- Multiple HLA calss I-restricted and class II-restricted T-cell epitopes were shown to be processed and presented from an exogenously added HIV-1 gag-p24 peptide complexed to a heat shock protein. T-cell recognition of the complex was shown to be inhibited by brefeldin A indicating an endoplasmic reticulum-dependent pathway.

HXB2 Location p24 (28–38)
Author Location p24 (161–171 NY-5)
Epitope `EEKAFSPEVIP`
Epitope name EP11
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (DQ5)
Donor MHC DQ3, DQ5, DR11, DR14, Drw52
Country United States

T-Helper CD4+

Assay type proliferation, CD4 T-cell Elispot - IFNγ, Chromium-release assay
Keywords subtype comparisons, rate of progression, acute/early infection, early treatment, variant cross-recognition or cross-neutralization
References Norris *et al.* 2004

- 5 CD4-T cell epitopes in Gag-p24 were studied, and a minimum epitope length of 6-16 amino acids was found to be required for CD4+ T cell proliferation. Cross-clade recognition was found to be impaired in 17/32 variants tested.
- Patient AC-01, who was infected with HIV-1 in 1997, recognized this epitope and epitope EPRGSDIAGT during acute infection, and 19 months post-initiation of ART therapy started during primary infection.
- The epitope EEKAFSPEVIP is highly conserved in B clade. Common variants from other clades were tested and all had markedly diminished responses, including eeRafspevip, eekaLspevip, and eDkafspevip (all found in clade A); eekGfspevip, eekGfNpevip (clades A and CRF01_AE); eekafspeIip (clade C); eekafNpevip (clade D).
- Minimum length peptides for the epitopes studied were not particularly optimal, and peptides longer than the minimum, up to 22 amino acids, were often as potent, in marked contrast to CD8+ T-cell responses.

HXB2 Location p24 (29–48)
Author Location Gag (161–180 HXB2)
Epitope `EKAFSPEVIPMFSALSEGAT`
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Donor MHC DRB1*0701, DRB1*1601
Country United States
Assay type CD4 T-cell Elispot - IFNγ
References Boritz *et al.* 2007

- CD4+ targeted P24 HXB2 peptides were compared with autologous sequences in 9 chronic unteated patients. 10 of 26 peptides in 5 responding patients exactly matched autologous sequences, indicating that CD4+ T cell responses can persist in chronic HIV-1 infection despite recognition of epitopes present in vivo.
- Responding patient had autologous sequence exactly matching this peptide.

HXB2 Location p24 (31–41)
Author Location Gag (171–181)
Epitope `AFSPEVIPMFT`
Subtype C
Immunogen HIV-1 infection
Species (MHC) human
Country India
Assay type CD4 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords subtype comparisons
References Kaushik *et al.* 2005

- T cell responses to Gag consensus C peptides were studied in C-infected patients from India. CD8+ responses were stronger and broader than CD4+ responses. IFN-γ response was higher in both CD8+ and CD4+ T cells than corresponding IL-2 response, that was detectable only in CD4+ T cells.
- 1/25 patients responded to this peptide (IFN-γ CD4+ response). IL-2 response was detectable.

HXB2 Location p24 (31–46)
Author Location p24 (163–177)
Epitope `AFSPEVIPMFSALSEC`
Immunogen in vitro stimulation or selection
Species (MHC) human
References Bedford *et al.* 1997

- Epitope elicits a primary proliferative response in PBMC from uninfected donors.
- Peptide contains a CTL epitope identified in HIV-positive patients.
- Peptide binds to HLA A*0201 and causes regulation of class I expression on T2 cells.
- Matches 3/3 anchor residues for HLA DR: **V**IPMF**S**AL**S**

HXB2 Location p24 (31–47)
Author Location p24 (31–47 B Consensus)
Epitope `AFSPEVIPMFSALSEGA`
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country United States
Assay type CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining, HLA binding
Keywords supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection
References Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN-γ EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 11% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNPs responded to many peptides, comparable to acute STI.

HXB2 Location p24 (31–48)
Author Location p24 (31–48)
Epitope `AFSPEVIPMFSALSEGAT`
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country Netherlands
Assay type Cytokine production
References Geels *et al.* 2006

- The relationship between CTL escape and the subsequent increase in viral load and CD4 Th responses was studied in 2 patients. In both patients T-cell reactivity and recognition were lost after CTL escape, and in 1 patient only the loss of CTL responses was paralleled by a decrease in IL-2 CD4 Th responses.
- Autologous sequences corresponding to known and predicted Th epitopes were analyzed. AFSPEVIPMFSALSEGAT had fixation of 2 mutations (AF[s/n]PEVIPMF[s/t]ALSEGAT) in 1 of the patients.

HXB2 Location p24 (31–50)
Author Location Gag (164–183)
Epitope `AFSPEVIPMFSALSEGATPQ`
Epitope name p24.4
Immunogen HIV-1 infection
Species (MHC) human (DRB1*0401)
Assay type Tetramer binding
Keywords assay standardization/improvement
References Scriba *et al.* 2005a

- Conditions required for optimal HLA class II tetramer staining of DR1- and DR4-restricted CD4+ T cells were studied. Staining was rapid and efficient and did not require internalization. Ultrasensitive detection of rare CD4+ T cells was performed by combining tetramer staining with magnetic bead enrichment, and level of detection was much higher than by standard flow-cytometric techniques.

HXB2 Location p24 (31–52)
Author Location p24 (163–184 SF2)
Epitope `AFSPEVIPMFSALSEGATPQDL`
Immunogen HIV-1 infection
Species (MHC) human
References Rosenberg *et al.* 1997

- Low viral load correlated with strong HIV-1-specific proliferative response.
- A proliferative response to this epitope was detected in two long term survivors.

HXB2 Location p24 (33–45)
Author Location p24 (33–45 clade B consensus)
Epitope `SPEVIPMFSALSE`
Subtype B
Immunogen HIV-1 infection, computer prediction
Species (MHC) human (DRB1*0101, DRB1*0301, DRB1*0401, DRB1*0405, DRB1*1101, DRB1*1501)
Country Brazil
Assay type CD4 T-cell Elispot - IFNγ, HLA binding
Keywords binding affinity, computational epitope prediction, cross-presentation by different HLA
References Fonseca *et al.* 2006

- TEPITOPE algorithm was used to screen the most conserved regions of clade B consensus sequence for multiple HLA-DR binding epitopes. Peptides predicted to bind 16 or more HLA-DR molecules were synthesized and further assessed in binding assays and for T-cell recognition in a cohort of 32 brazilian HIV-1 chronically infected individuals.
- While the reacting peptide is SPEVIPMFSALSE, shorter VIPMFSALSE was predicted by TEPITOPE to bind HLA-DR molecules. Flanking amino acids were added to increase the efficiency of in vitro peptide presentation to CD4 T cells.

HXB2 Location p24 (34–49)
Author Location p24 (HXB2)
Epitope `PEVIPMFSALSEGATP`
Subtype B
Immunogen in vitro stimulation or selection
Species (MHC) human (DR1)
Assay type CD4 T-cell Elispot - IFNγ
Keywords epitope processing, vaccine antigen design, characterizing CD8+ T cells
References SenGupta *et al.* 2004

- Multiple HLA class I-restricted and class II-restricted T-cell epitopes were shown to be processed and presented from an exogenously added HIV-1 gag-p24 peptide complexed to a heat shock protein. T-cell recognition of the complex was shown to be inhibited by brefeldin A indicating an endoplasmic reticulum-dependent pathway.

Epitope `PEVIPMFSALSEGATP`
Epitope name PP16
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (DR1)
Donor MHC DQ5, DQ7, DR1, DR11, DRw52
Country United States
Assay type proliferation, CD4 T-cell Elispot - IFNγ, Chromium-release assay
Keywords rate of progression, acute/early infection, early treatment, variant cross-recognition or cross-neutralization
References Norris *et al.* 2004

- 5 CD4-T cell epitopes in Gag-p24 were studied, and a minimum epitope length of 6-16 amino acids was found to be required for CD4+ T-cell proliferation. Cross-clade recognition was studied and found to be impaired in 17/32 variants tested.
- Patient AC-25 was an acute seroconvertor at the time of sampling, infected with HIV-1 in 1998, and given ARVs during primary infection. The study subject was resampled 18 months after initiation of therapy.
- Natural variants of the epitope PEVIPMFSALSEGATP diminished the level of the response, including pevipmfPalsegStp and pevipmfsalsegStp, found in CRF01_AE; peIipmfTalsegatp, clade C; pevipmfsalSegatp, clade B; pevipmfTalsegatp, clades A, B and C; and pevipVfsalsegatp, clade A.
- Minimum length peptides for the epitopes studies were not particularly optimal, and peptides longer than the minimum, up to 22 amino acids, were often as potent, in marked contrast to CD8+ T-cell responses.

HXB2 Location p24 (34–49)
Author Location p24
Epitope `PEVIPMFSALSEGATP`
Epitope name PP16
Immunogen HIV-1 infection

T-Helper CD4+

Species (MHC) human (DR1)
Assay type proliferation, Tetramer binding, CD4 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords binding affinity, escape, optimal epitope, antagonism
References Norris *et al.* 2006

- This study demonstrates a mechanism of antagonism by a peptide shorter than the minimum length epitope for an HIV p24-specific CD4+ T-cell clone.
- Truncation of the peptide from PEVIPMFSALSEGATP (PP16) to PEVIPMFSALSEG (PG13) rendered the peptide unable to elicit proliferation, IFN-γ release, or serine esterase release, even though it retained strong binding to MHC.
- Although both the original and truncated peptide-MHC complexes bound TCR clone, PEVIPMFSALSEGATP-DR1 tetramer bound with higher avidity than PEVIPMFSALSEG-DR1 tetramer, suggesting that tighter association of the peptide-MHC complex with the TCR is associated with the extent of T-cell activation.
- G/P substitution in the original full-length peptide (PEVIPMFSALSE[g/p]ATP) led to complete loss of agonist activity, and PEVIPMFSALSEpATP became antagonistic.

HXB2 Location p24 (35–44)
Author Location p24 (HXB2)
Epitope `EVIPMFSALS`
Subtype B
Immunogen in vitro stimulation or selection
Species (MHC) human (DR4)
Assay type CD4 T-cell Elispot - IFNγ
Keywords epitope processing, vaccine antigen design, characterizing CD8+ T cells
References SenGupta *et al.* 2004

- Multiple HLA calss I-restricted and class II-restricted T-cell epitopes were shown to be processed and presented from an exogenously added HIV-1 gag-p24 peptide complexed to a heat shock protein. T-cell recognition of the complex was shown to be inhibited by brefeldin A indicating an endoplasmic reticulum-dependent pathway.

Epitope name Gag 11.2
Immunogen vaccine
Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* B clade *HIV component:* Env, Gag, Protease, Rev, RT, Tat, Vpu
Species (MHC) macaque
Assay type T-cell Elispot, Intracellular cytokine staining
Keywords subtype comparisons, memory cells
References Amara *et al.* 2005

- Clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02_AG consensus Gag in macaques. The activity was better-conserved for CD8 than CD4 T cells.
- 3/5 CD8 epitopes and 2/8 CD4 epitopes were conserved across multiple HIV-1 clades. All 5 CD8, and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation.
- CD4 T-cell epitope previously reported for human is ETINEEAAEWDRVHPC. HLA restriction: DRB1*03, DRB1*0101.
- The response elicited to the B clade epitope INEEAAEWDRV does not cross-react with the CRF02_AG form INdEAAEWDRV. The epitope is however conserved in CRF01_AE and CRF02_AG consensus sequences. Other clades tend to have L in the last position (INEEAAEWDR[v/l]).

HXB2 Location p24 (73–83)
Author Location Gag (208–218)
Epitope INEEAAEWDRL
Subtype C
Immunogen HIV-1 infection
Species (MHC) human
Country India
Assay type CD4 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords subtype comparisons
References Kaushik *et al.* 2005

- T cell responses to Gag consensus C peptides were studied in C-infected patients from India. CD8+ responses were stronger and broader than CD4+ responses. IFN-γ response was higher in both CD8+ and CD4+ T cells than corresponding IL-2 response, that was detectable only in CD4+ T cells.
- 1/25 patients responded to this peptide (IFN-γ CD4+ response). IL-2 response was not detectable.

Donor MHC A29, A30, B35, B8, DRB1*03, DRB1*13
Keywords HAART, ART, Th1, Th2, TCR usage
References Lotti *et al.* 2002

- 10/49 chronically HIV-1 infected patients had low p55-Gag-specific CD4+ T cell responses prior to therapy, and these responses remained unchanged 3 and 6 months after initiation of HAART. There was no difference in level of response in those with or without a detectable p55 response.
- For one individual, patient F45 CDC stage A2, CD4+ p55 responding clones were generated. Her response was consistently strong and heterogeneous in terms of HLA restriction and Vβ usage, and some clones had a Th1 cytokine secretion profile (high IFNgamma production) while some had a Th2 profile (high IL-4 and IL-5 production). 5/10 CD4+ clones could also induce cytotoxicity.
- 4/10 clones from patient F45 had their epitopes mapped using overlapping peptides. Clone 12 recognized this peptide sequence restricted by DRB1*03 using TCR Vβ 22. This clone had a SI of 12.4 to p55, 49.6 to peptide, secreted low levels of IFNgamma, indicative of a Th1 response. Clone 12 had cytotoxic activity, mediated through both a perforin and a Fas-based pathway.

Epitope EWDRVHPVHA
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (DRB1*0101)
Donor MHC DQ1, DQ5, DR51, DRB1*0101, DRB1*1501
Assay type proliferation, T-cell Elispot, Intracellular cytokine staining
Keywords HAART, ART
References Boritz *et al.* 2003

- HIV infected individuals with advanced disease often have only weak or undetectable HIV specific Th responses, and HAART can sometimes restore Th HIV recognition in such cases. The repertoire of Th responses to p24 in an individual who responded to HAART after having a CD4+ T-cell count of 0 cells ul was determined. Eleven clonotypes were found among 13 clones, recognizing eight distinct epitopes, with a range of MHC affinities and functional avidities. Multiple Gag p24 peptides were also recognized using CD4 Elispot assays based on samples from six additional HAART-treated CD4 T-cell-reconstituted subjects. Two clones recognized this epitope.

Keywords acute/early infection, early treatment, variant cross-recognition or cross-neutralization
References Norris *et al.* 2004

- 5 CD4-T cell epitopes in Gag-p24 were studied, and a minimum epitope length of 6-16 amino acids was found to be required for CD4+ T-cell proliferation. Cross-clade recognition was studied and found to be impaired in 17/32 variants tested.
- Patient CTS01, who was infected with HIV-1 in 1998, was an LTNP, and recognized this epitope.
- This epitope VHAGPIAPG was the most variable of the 5 epitopes studied. Only the C variant Ihagpiapg did not diminish the response. All other variations had impaired responses: vhagpVapg, found in clades A, B, C, and D; vQagpVapg,clades B, C, D; AQagpFPpg, IhagpVapg, AhagpVapg, and vQagpiP, all found in clade A; AQagpiapg, clade B; and vPagpiapg, clade C.
- Minimum length peptides for the epitopes studies were not particularly optimal, and peptides longer than the minimum, up to 22 amino acids, were often as potent, in marked contrast to CD8+ T-cell responses.

Assay type CD4 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords subtype comparisons
References Kaushik *et al.* 2005

- T cell responses to Gag consensus C peptides were studied in C-infected patients from India. CD8+ responses were stronger and broader than CD4+ responses. IFN-γ response was higher in both CD8+ and CD4+ T cells than corresponding IL-2 response, that was detectable only in CD4+ T cells.
- 1/25 patients responded to this peptide (IFN-γ CD4+ response). IL-2 response was not detectable.

HXB2 Location p24 (119–133)
Author Location p24 (251–265)
Epitope `TNNPPIPBGEIYKRW`
Immunogen HIV-1 infection
Species (MHC) human (DRB1*1301)
Keywords binding affinity, HAART, ART
References Blankson & Siliciano 2001; Malhotra *et al.* 2001

- The DRB1*13-DQB1*06 haplotype is associated with maintained viral suppression after HAART – 7/7 early-treated DRB1*13-DQB1*06 positive people, but only 3/14 (21%) of those who did not have DRB1*13-DQB1*06, maintained viral suppression for 18 months.
- PBMC from individuals with the haplotype DRB1*13-DQB1*06 displayed increased IFN-γ secretion and stronger proliferative responses against p24 80 weeks post treatment.
- DRB1*13-DQB1*06 was also found to be enriched among long-term non-progressors (LTNPs) (it was in 9/18 versus, versus 21% of the general population)
- This epitope was mapped with truncated peptides using the Elispot assay.
- Two distinct DRB1*13 epitopes were defined in the peptide region spanning 251 to 270, and this 20-mer bound with very high affinity to DRB1*1302 – DRB1*1301 and DRB1*1302 would be expected to have very similar binding properties.

HXB2 Location p24 (119–133)

Epitope `TNNPPIPBGEIYKRW`
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country Netherlands
Assay type Cytokine production
References Geels *et al.* 2006

- The relationship between CTL escape and the subsequent increase in viral load and CD4 Th responses was studied in 2 patients. In both patients T-cell reactivity and recognition were lost after CTL escape, and in 1 patient only the loss of CTL responses was paralleled by a decrease in IL-2 CD4 Th responses.
- Autologous sequences corresponding to known and predicted T-helper epitopes were analyzed. TNNPPIPBGEIYKRW had fixation of R14K mutation (TNNPPIPBGEIYKkW) in 1 of the patients.

T-Helper CD4+

Immunogen vaccine
Vector/Type: Listeria monocytogenes *Strain:* B clade HXB2 *HIV component:* Gag
Species (MHC) mouse (H-2^d)
Keywords immunodominance
References Mata & Paterson 1999

- BALB/c and C57BL/6 mice were immunized with *Listeria monocytogenes* (Lm-Gag) expressing HIV-1 HXB2 Gag.
- L. monocytogenes is a gram-positive bacteria that enters the macrophage on phagocytosis and lives in the cytoplasm; secreted *L. monocytogenes* antigens are processed and presented by both class I and class II pathways.
- The class II Th response was probed using 20mer peptides that overlapped by 10; the peptide MPPIPVGEIYKRWIILGLNK gave the immunodominant response for the H-2^d haplotype, but was not recognized in H-2^b mice.

HXB2 Location p24 (121–140)
Author Location Gag (197–205)
Epitope `NPPIPVGEIYKRWIILGLNK`
Immunogen vaccine
Vector/Type: vaccinia *Strain:* B clade HXB2 *HIV component:* Gag
Species (MHC) mouse (H-2^d)
Country United States
Assay type proliferation, T-cell Elispot
Keywords vaccine antigen design
References Kwak *et al.* 2004

- A recombinant vaccinia virus with HIV-1 Gag replacing the cytoplasmic domain of the B5R protein was shown to induce better primary CD4 response than recombinant vaccinia virus expressing Gag from the TK-locus; CD8 responses were less specific. When immunized BALB/c mice were challenged with a recombinant Listeria that expresses HIV-Gag, lower colony counts of Listeria were found in the liver and spleen of mice immunized with virus expressing B5R-Gag fusion protein.

HXB2 Location p24 (121–140)
Author Location p24 (121–140)
Epitope `NPPIPVGEIYKRWIILGLNK`
Immunogen vaccine
Vector/Type: DNA, virus-like particle (VLP), HIV infected-cell lysate, polyepitope *HIV component:* Env, Gag, Nef, Pol
Species (MHC) mouse (H-2^d)
Country Russia
Assay type T-cell Elispot
Keywords vaccine antigen design
References Bazhan *et al.* 2008

- Two immunogens were combined in the CombiHIV vac (VLP-TBI-pcDNATCI) vaccine: artificial polyepitope protein TBI, containing T- and B-cell epitopes from Env and Gag and the DNA vaccine construct pcDNA-TCI, carrying CTL and CD4+ epitopes from Env, Gag, Pol, Nef.
- Combination of two B- and T-cell immunogens resulted in increase in the antibody response (but not CTL response) to both TBI protein and the proteins from HIV-1 lysate, compared to the level of antibodies induced by immunization with either immunogen alone. The synergistic effect in the induction of B-cell-mediated response was explained by the presence of CD4+ T-helper epitopes in TCI, due to stimulation of B-cell proliferation and differentiation.
- NPPIPVGEIYKRWIILGLNK is a previously known epitope that is a part of TCI fragment NPPIPVGEIYRWIIL-GLNKIVRMYSPTSI in this vaccine construct.

Epitope PVGEIYKRWIILGLN
Epitope name G065
Immunogen HIV-1 infection
Species (MHC) human
Country Canada
Assay type proliferation, Flow cytometric T-cell cytokine assay
Keywords memory cells
References Younes *et al.* 2003

- HIV-1-specific CD4+ T-cell responses were analyzed for 6 years since primary infection, in 10 aviremic and 8 viremic patients.
- CD4+ T cells proliferating responses were correlated with the frequency of CD4+ T cells secreting IL-2 in aviremic patients. In viremic patients, CD4+ T cell proliferative response was impaired despite of the high frequencies of IFN-γ, but not IL-2-producing CD4+ T cells in periods of elevated viremia, suggesting that long-term CD4+ memory depends on IL-2-producing CD4+ T cells and that IFN-γ only-producing cells are short lived.

Epitope KRWIILGLNKIVRMY
Immunogen vaccine
Vector/Type: virus-like particle (VLP) *Strain:* B clade SF2 *HIV component:* p24 Gag
Species (MHC) macaque
References Mills *et al.* 1990

- Responses to 3 T-cell and multiple linear B-cell epitopes were found in vaccinated macaques – epitope response defined by T-cell clone.

HXB2 Location p24 (131–150)
Author Location Gag (264–283)
Epitope KRWIILGLNKIVRMYSPTSI
Epitope name p24.14
Immunogen HIV-1 infection
Species (MHC) human (DRB1*0101)
Assay type Tetramer binding
Keywords assay standardization/improvement
References Scriba *et al.* 2005a

- Conditions required for optimal HLA class II tetramer staining of DR1- and DR4-restricted CD4+ T cells were studied. Staining was rapid and efficient and did not require internalization. Ultrasensitive detection of rare CD4+ T cells was performed by combining tetramer staining with magnetic bead enrichment, and level of detection was much higher than by standard flow-cytometric techniques.

HXB2 Location p24 (131–150)

Country Brazil
Assay type CD4 T-cell Elispot - IFNγ, HLA binding

T-Helper CD4+

Keywords binding affinity, computational epitope prediction, cross-presentation by different HLA
References Fonseca *et al.* 2006

- TEPITOPE algorithm was used to screen the most conserved regions of clade B consensus sequence for multiple HLA-DR binding epitopes. Peptides predicted to bind 16 or more HLA-DR molecules were synthesized and further assessed in binding assays and for T-cell recognition in a cohort of 32 brazilian HIV-1 chronically infected individuals.
- While the reacting peptide is KRWIILGLNKIVRMYSPTSI, shorter WIILGLNKIVRMYSPTSI peptide was predicted by TEPITOPE to bind HLA-DR molecules. Flanking amino acids were added to increase the efficiency of in vitro peptide presentation to CD4 T cells.

HXB2 Location p24 (131–152)
Author Location p24 (263–284 SF2)
Epitope `KRWIILGLNKIVRMYSPTSILD`
Immunogen HIV-1 infection
Species (MHC) human
References Rosenberg *et al.* 1997

- Low viral load correlated with strong HIV-1-specific proliferative response.
- A proliferative response to this epitope was detected in two long term survivors.

Epitope name Gag 14.2
Immunogen vaccine
Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* B clade *HIV component:* Env, Gag, Protease, Rev, RT, Tat, Vpu
Species (MHC) macaque
Assay type T-cell Elispot, Intracellular cytokine staining
Keywords subtype comparisons, variant cross-recognition or cross-neutralization, memory cells
References Amara *et al.* 2005

- Clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02_AG consensus Gag in macaques. The activity was better-conserved for CD8 than CD4 T cells.
- 3/5 CD8 epitopes and 2/8 CD4 epitopes were conserved across multiple HIV-1 clades. All 5 CD8, and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation.
- The similar reported human epitope in this case is KRWIILGLNKIVRMY, which is presented by 13 HLA-DR alleles.
- The response elicited to the B clade epitope WIILGLNKIVR cross-reacts with the CRF02_AG form WIvLGLNKIVR. WIILGLNKIVR is mostly conserved across other clades.

Species (MHC) human (DRB1*0101, DRB1*0401, DRB1*0405, DRB1*1101, DRB1*1302, DRB1*1501, DRB5*0101)
Country Russia
Assay type T-cell Elispot
Keywords vaccine antigen design
References Bazhan *et al.* 2008

- Two immunogens were combined in the CombiHIV vac (VLP-TBI-pcDNATCI) vaccine: artificial polyepitope protein TBI, containing T- and B-cell epitopes from Env and Gag and the DNA vaccine construct pcDNA-TCI, carrying CTL and CD4+ epitopes from Env, Gag, Pol, Nef.
- Combination of two B- and T-cell immunogens resulted in increase in the antibody response (but not CTL response) to both TBI protein and the proteins from HIV-1 lysate, compared to the level of antibodies induced by immunization with either immunogen alone. The synergistic effect in the induction of B-cell-mediated response was explained by the presence of CD4+ T-helper epitopes in TCI, due to stimulation of B-cell proliferation and differentiation.
- KRWIILGLNKIVRMY is a previously known epitope that is a part of TCI fragment NPPIPVGEIYRWIILGLNKIVRMYSPTSI in this vaccine construct.

Epitope name G067
Immunogen HIV-1 infection
Species (MHC) human
Country Canada
Assay type proliferation, Flow cytometric T-cell cytokine assay
Keywords memory cells
References Younes *et al.* 2003

- HIV-1-specific CD4+ T-cell responses were analyzed for 6 years since primary infection, in 10 aviremic and 8 viremic patients.
- CD4+ T cells proliferating responses were correlated with the frequency of CD4+ T cells secreting IL-2 in aviremic patients. In viremic patients, CD4+ T cell proliferative response was impaired despite of the high frequencies of IFN-γ, but not IL-2-producing CD4+ T cells in periods of elevated viremia, suggesting that long-term CD4+ memory depends on IL-2-producing CD4+ T cells and that IFN-γ only-producing cells are short lived.

Donor MHC DQ2, DQ3, DR4, DR7
Keywords immunodominance, Th1, Th2, TCR usage
References Venturini *et al.* 2002

- PBMC from a seronegative donor, the healthy brother of a pair of monozygotic twins discordant for HIV-1 infection, were used to generate HIV-1 Gag-specific CD4+ T-cell clones by *in vitro* immunization with HIV-1 overlapping 20mer peptides spanning p55. Six clones were generated by limiting dilution. All reacted with p24 except one which recognized a p24 peptide and a p6 peptide. All CD4+ T cell clones were HLA class II DR restricted.
- Clone 6 recognized three peptides including this one with a Th1 response using TCR Vβ 6 (6s5A1N1). Sequencing TCR Vβ regions of colonies from clone 6 suggested this was a clonal population. Assays using different peptide concentrations suggest that this peptide, 271-290, contains the main epitope of this clone. Upon activation, clone 6 was observed to induce a cytopathic effect in the adherent layer of fibroblasts expressing HLA DR4W14 and -W15. Clone 6 was activated in response to vaccinia virus Gag-infected B-LCL, so it could recognize naturally processed epitopes.
- Clone 37 recognized this peptide sequence with a Th2 response using TCR Vβ 3, and was a homogeneous T-cell population. This clone was only activated by peptide, not by processed protein from vaccinia virus Gag-infected B-LCL.
- Clone 97 recognized this peptide sequence with a using TCR Vβ 9 and 14; the two TCR receptors used indicates this limiting dilution represents a mixed population. This clone was only activated by peptide, not by processed protein from vaccinia virus Gag-infected B-LCL.

References Venturini *et al.* 2002
- PBMC from a seronegative donor, the healthy brother of a pair of monozygotic twins discordant for HIV-1 infection, were used to generate HIV-1 Gag-specific CD4+ T-cell clones by *in vitro* immunization with HIV-1 overlapping 20mer peptides spanning p55. Six clones were generated by limiting dilution. All reacted with p24 except one which recognized a p24 peptide and a p6 peptide. All CD4+ T cell clones were HLA class II DR restricted.

T-Helper CD4+

- Clone 6 recognized three peptides including this one with a Th1 response using TCR Vβ 6 (6s5A1N1). Sequencing TCR Vβ regions of colonies from clone 6 suggested this was a clonal population. Assays using different peptide concentrations suggest that this peptide does not carry the main epitope of this clone.

Assay type proliferation, Flow cytometric T-cell cytokine assay
Keywords memory cells
References Younes *et al.* 2003

- HIV-1-specific CD4+ T-cell responses were analyzed for 6 years since primary infection, in 10 aviremic and 8 viremic patients.
- CD4+ T cells proliferating responses were correlated with the frequency of CD4+ T cells secreting IL-2 in aviremic patients. In viremic patients, CD4+ T cell proliferative response was impaired despite of the high frequencies of IFN-γ, but not IL-2-producing CD4+ T cells in periods of elevated viremia, suggesting that long-term CD4+ memory depends on IL-2-producing CD4+ T cells and that IFN-γ only-producing cells are short lived.

Assay type CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining, HLA binding
Keywords supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection
References Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN-γ EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 11% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNPs responded to many peptides, comparable to acute STI.

T-Helper CD4+

Donor MHC DQ1, DQ5, DR51, DRB1*0101, DRB1*1501
Assay type proliferation, T-cell Elispot, Intracellular cytokine staining
Keywords HAART, ART
References Boritz *et al.* 2003

- HIV infected individuals with advanced disease often have only weak or undetectable HIV specific Th responses, and HAART can sometimes restore Th HIV recognition in such cases. The repertoire of Th responses to p24 in an individual who responded to HAART after having a CD4+ T-cell count of 0 cells ul was determined. Eleven clonotypes were found among 13 clones, recognizing eight distinct epitopes, with a range of MHC affinities and functional avidities. Multiple Gag p24 peptides were recognized using CD4 Elispot assays based on samples from six additional HAART-treated CD4 T-cell-reconstituted subjects.

Epitope FYKTLRAEQASQE
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (DRB1*0101, DRB1*0401, DRB1*0405, DRB1*1101, DRB1*1501, DRB5*0101)
Country United States
Assay type CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining, HLA binding
Keywords supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection
References Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN-γ EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- This is the core of the peptide and was the most often recognized, with responses by 58% of the study group. The core epitope, FYKTLRAEQASQE, could bind 6/8 HLA-DR molecules tested.

Immunogen HIV-1 infection, vaccine
Vector/Type: modified vaccinia Ankara (MVA) *Strain:* A clade, multiple epitope immunogen *HIV component:* p17/p24 Gag
Species (MHC) human
Country United Kingdom
Assay type proliferation, CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords HAART, ART, vaccine-induced epitopes, therapeutic vaccine
References Ondondo *et al.* 2006

- A vaccinia-gag vaccine stimulated broad functional T helper responses in 16 chronically infected HAART patients. Gag-specific CD4+ T cell responses targeted known and new epitopes, several of which were also recognized by HIV-uninfected subjects.
- Both DRFFKTLRAEQAT and FFKTLRAEQATQE stimulated stronger response than 15-mer originally tested peptide DRFFKTLRAEQATQE. Peptides lacking FKTLRAEQA (FKTLRAEQATQEVKNW and RDYVDRFFKTLRAEQA) did not stimulate a response, suggesting that the FKTLRAEQA, which fits the predicted peptide-binding motif for HLA-DRB1*1301 and *1302, represented the core binding region of two distinct epitopes in this region.

Epitope YKTLRAEQASQEVKN
Epitope name G076
Immunogen HIV-1 infection
Species (MHC) human
Country Canada
Assay type proliferation, Flow cytometric T-cell cytokine assay
Keywords memory cells
References Younes *et al.* 2003

- HIV-1-specific CD4+ T-cell responses were analyzed for 6 years since primary infection, in 10 aviremic and 8 viremic patients.
- CD4+ T cells proliferating responses were correlated with the frequency of CD4+ T cells secreting IL-2 in aviremic patients. In viremic patients, CD4+ T cell proliferative response was impaired despite of the high frequencies of IFN-γ, but not IL-2-producing CD4+ T cells in periods of elevated viremia, suggesting that long-term CD4+ memory depends on IL-2-producing CD4+ T cells and that IFN-γ only-producing cells are short lived.

Keywords HAART, ART, Th1, Th2, TCR usage
References Lotti *et al.* 2002

- 10/49 chronically HIV-1 infected patients had low p55-Gag-specific CD4+ T cell responses prior to therapy, and these responses remained unchanged 3 and 6 months after initiation of HAART. There was no difference in level of response in those with or without a detectable p55 response.
- For one individual, patient F45 CDC stage A2, CD4+ p55 responding clones were generated. Her response was consistently strong and heterogeneous in terms of HLA restriction and Vβ usage, and some clones had a Th1 cytokine secretion profile (high IFNgamma production) while some had a Th2 profile (high IL-4 and IL-5 production). 5/10 CD4+ clones could also induce cytotoxicity.
- 4/10 clones from patient F45 had their epitopes mapped using overlapping peptides. Clone 26 recognized this peptide sequence restricted by DRB1*03. This clone had a SI of 4.1 to p55, 5.3 to peptide, secreted high levels of IFN-γ, indicative of a Th1 response, but also IL-4 and IL-5. Clone 26 had no cytotoxic activity.

Keywords HAART, ART, supervised treatment interruptions (STI)
References Arnedo-Valero *et al.* 2004

- T cell immune responses following STI were monitored in two chronically HIV-1 infected partners (A and B) who had contracted HIV-1 during 1992. STI induced strong transitory CD4+ and CD8+ T cell responses in both patients. The viruses remained very closely related over 10 years, despite the two individuals having different HLA types; the authors suggest the maintained similarity does not support a strong role for HLA driven HIV diversity as has been claimed in Moore et al. (Science 2002).
- During the second treatment stop, patient A developed a strong proliferative response to p24, and multiple strong CD8+ T cell repsonses to Env, Pol, Gag and Nef. This patient was able to control viral load for two years follow up without therapy. Patient B developed a very weak CD4+ T cell response against p24 during breaks in therapy, and had CD8+ responses to two epitopes. Patient A: A01, A32, B*1410, B15; Patient B: A*3101, A68, B*4403, B51.

Assay type proliferation, Intracellular cytokine staining
Keywords HIV exposed persistently seronegative (HEPS)
References Alimonti *et al.* 2005

- CD4+ T cell responses were studied in high-risk HIV-seronegative (Kenya) women, HIV-positive women (Kenya) and low-risk HIV-seronegative women (Canada), using 15mer peptides (overlapping by 11 amino acids) spanning p24 HXB2 sequence.
- Compared to HIV-positive women, high-risk HIV-seronegative women had significantly lower level of CD4+ specific immune activation and apoptosis. Lower proportion of HIV-seronegative women showed responses by the short-term CD4+ specific inracellular cytokine staining assay, while the proportions showing responses by the long-term CD8+-depleted T cell proliferation assay were similar. HIV-seronegative responders had 4.5-fold stronger response than the HIV+ group.

References Boritz *et al.* 2003

- HIV infected individuals with advanced disease often have only weak or undetectable HIV-specific Th responses, and HAART can sometimes restore Th HIV recognition in such cases. The repertoire of Th responses to p24 in an individual who responded to HAART after having a CD4+ T-cell count of 0 cells/ul was determined. Eleven clonotypes were found among 13 clones, recognizing 8 distinct epitopes, with a range of MHC affinities and functional avidities. Multiple Gag p24 peptides were recognized using CD4 EliSpot assays based on samples from 6 additional HAART-treated CD4 T-cell-reconstituted subjects.
- The two Th clones that recognized this epitope utilized TCR Vβ2 and Bβ8.1.

Author Location p15 (66–81 B consensus)
Epitope RQANFLGKIWPSHKGR
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (DR01*0401, DRB1*0101, DRB1*0405, DRB1*1101, DRB1*1302, DRB1*1501, DRB5*0101)
Country United States
Assay type CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining, HLA binding
Keywords supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection
References Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN-γ EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 28% of the study group.

T-Helper CD4+

- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The peptides that were recognized by the most people were able to bind broadly to multiple HLA-DR molecules.This peptide showed high cross-reactive binding capacity and bound to 7/8 tested HLA-DR molecules.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNPs responded to many peptides, comparable to acute STI.

Immunogen vaccine
Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* B clade *HIV component:* Env, Gag, Protease, Rev, RT, Tat, Vpu
Species (MHC) macaque
Assay type T-cell Elispot, Intracellular cytokine staining
Keywords subtype comparisons, memory cells
References Amara *et al.* 2005

- Clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02_AG consensus Gag in macaques. The activity was better-conserved for CD8 than CD4 T cells.
- 3/5 CD8 epitopes and 2/8 CD4 epitopes were conserved across multiple HIV-1 clades. All 5 CD8, and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation. TTTPPQKQEPI was not reported for human infections.
- The response elicited to the B clade epitope TTTPPQKQEPI does not cross-react with the CRF02_AG form ipssP-KQEPr. The epitope is highly variable across other clades.

Epitope DKELYPLTSLRSLFGNDPSSQ
Immunogen in vitro stimulation or selection
Species (MHC) human
Donor MHC DQ2, DQ3, DR4, DR7
Keywords immunodominance, Th1, Th2, TCR usage
References Venturini *et al.* 2002

- PBMC from a seronegative donor, the healthy brother of a pair of monozygotic twins discordant for HIV-1 infection, were used to generate HIV-1 Gag-specific CD4+ T-cell clones by *in vitro* immunization with HIV-1 overlapping 20mer peptides spanning p55. Six clones were generated by limiting dilution. All reacted with p24 except one which recognized a p24 peptide and a p6 peptide. All CD4+ T cell clones were HLA class II DR restricted.
- Clone 74 recognized two peptides, including this one, with a Th1 response using TCR Vβ 13 (13s1); it required 200 ng/ml (100 nM) and 1 µg/ml (0.5 µM) for stimulation by peptides 480-500 and 261-280, respectively. Sequencing TCR Vβ regions of colonies from clone 74 suggested this was a clonal population. Clone 74 was activated in response to vaccinia virus Gag-infected B-LCL, so it could recognize naturally processed epitopes.

III-B-5 Gag Helper/CD4+ T-cell epitopes

HXB2 Location Gag
Author Location p55
Epitope
Immunogen HIV-1 infection
Species (MHC) human (DRB1*03, DRB1*13)
Donor MHC A29, A30, B35, B8, DRB1*03, DRB1*13
Keywords HAART, ART, Th1, Th2, TCR usage
References Lotti *et al.* 2002

- 10/49 chronically HIV-1 infected patients had low p55-Gag-specific CD4+ T cell responses prior to therapy, and these responses remained unchanged 3 and 6 months after initiation of HAART. There was no difference in level of response in those with or without a detectable p55 response.
- For one individual, patient F45 CDC stage A2, CD4+ p55 responding clones were generated. Her response was consistently strong and heterogeneous in terms of HLA restriction and Vβ usage. Two clones were DRB1*13 restricted and used TCR Vβ 17+19 or 5.1. Three clones were DRB1*03 restricted and used TCR Vβ 22. Some clones had a Th1 cytokine secretion profile (high IFNgamma production) while some had a Th2 profile (high IL-4 and IL-5 production).

HXB2 Location Gag
Author Location p24
Epitope
Immunogen vaccine
Vector/Type: DNA *HIV component:* Gag
Species (MHC) mouse (H-2^d)
References Qiu *et al.* 2000

- Mice were injected with plasmid DNA at 0, 2 and 4 weeks and lymphocyte proliferation was measured after 6 weeks with recombinant p24 protein.
- Secreted HIV-1 Gag expression vectors generated a stronger response than standard Gag or cytoplasmic Gag expression vectors.
- IFN-γ levels were increased compared to an undetectable IL-4 response.
- CTL levels were also increased in secreted Gag expression vaccination studies.

HXB2 Location Gag

Keywords HAART, ART
References Rosenberg *et al.* 1999

- This paper reviews the role of T-cells in viral control and HIV disease outcome.
- Strong anti-p24 lymphoproliferative responses were found in seven persons who were treated with potent anti-viral therapy during acute HIV-1 infection syndrome.
- This suggests that Th cells are part of the normal response to HIV-1 infection, but their numbers are rapidly diminished by either being infected during the peak viremia or by activation-induced cell death – if peak viremia can be controlled, a robust anti-p24 Th response can be maintained.

Epitope
Subtype B
Immunogen vaccine
Vector/Type: DNA prime with vaccinia boost *Strain:* B clade LAI *HIV component:* Env, Gag
Species (MHC) macaque
Keywords Th1, Th2
References Kent *et al.* 1998

- Priming with an HIV-DNA vaccine and boosting with a vaccinia construct induced greater levels of HIV T-cell immunity than either vaccine alone.
- The proliferative response to Env and Gag after the DNA vaccination had a mean SI of 1.5-4, but after boosting with rHIV-fowlpox virus, there was a 6-17 fold increase in the mean SI for HIV Gag and Env – The Th response happened despite a fall in Ab titers, suggesting that the Th response was primarily Th1, not Th2. The CTL response was also enhanced.

HXB2 Location Gag
Author Location
Epitope
Immunogen vaccine
Vector/Type: DNA, protein, virus-like particle (VLP), ISCOM
Species (MHC) macaque
Keywords Th1, Th2
References Heeney *et al.* 1999

- Ten different vaccine strategies were evaluated for their ability to protect from infection in a rhesus macaque model using a non-pathogenic SHIV challenge.
- Protection correlated with the magnitude of NAb responses, beta-chemokines, and a balanced Th response.
- DNA, protein+adjuvant, VLP and ISCOM vaccines were tested.
- HIV-1/ISCOMS gave the highest NAb titers, Th1 and Th2 responses, was the only vaccine formulation tested with a detectable CTL response, and gave enhanced beta-chemokine production.

HXB2 Location Gag
Author Location Gag/Pol (MN)
Epitope
Immunogen vaccine
Vector/Type: DNA *Strain:* B clade MN *HIV component:* Env, Gag, Pol *Adjuvant:* CD80, CD86
Species (MHC) chimpanzee
References Kim *et al.* 1998

- Co-stimulatory molecules co-expressed with an HIV-1 immunogen in a DNA vaccine used to enhance the immune response – co-expression of CD86, but not CD80, dramatically increased both HIV Env and Gag/Pol specific CTL and Th proliferative responses.

References Imami *et al.* 2002b

- 70 patients with chronic disease progression, 10 clinical non-progressors, and 3 immunologically discordant progressors (individuals who controlled viremia but had progressive CD4+ T-cell decline) were analyzed for their T-helper cell responses to p24 and cytokine profile.
- SF2 p24 20mer peptides overlapping by 10 were used to assess the response in the different groups. At least 1/10 and up to 7/10 nonprogressors had a proliferative response with every one of the 22 p24 overlapping peptides. All peptides produced an IL-2 (Th1) response in at least one of the 10 non-progressors. IL-4 (Th2) responses were strong, but somewhat less comprehensive as 6/22 peptides elicited no IL-4 production, and fewer IL-4 responses were see per peptide. In contrast, only 1/10 progressors had a clear proliferative and IL-2 response to 2/22 peptides, and neither one made an IL-4 response.
- The results taken together suggest that a balanced Th1/Th2 response to HIV is important for viral control in long-term non-progression.
- One immunologically discordant progressor became symptomatic while on the study. He showed a rapid decline in proliferative activity at that point, and a shift from a Th1 to a Th2 IL-4 producing response.

References Wang *et al.* 2002a

- A 51 year old male, infected presumably in 1988, diagnosed seropositive in 1993, has remained asymptomatic and is a long term non-progressor. He had very low proviral copy number in his PBMCs with high levels of G-A hypermutation, resulting in multiple stop codons, and viral replication was not evident. He was heterozygous for the CCR5 delta 32 allele, and has undergone a variety of treatments through the years. T cell responses in this patient and in two additional LTNPs were described, and this patient had particularly intense CD4+ Th responses.
- PBMC from this patient resisted infection from CCR5, CXCR4 and dual-tropic HIV-1 strains. Purified CD4+ T cells became infected, however, without detectable cytopathic effect. CD8+ T cells were shown to protect PBMCs from infection, and this protection was not mediated by IFNgamma. Undefined CD8 T-cell secreted factors were stimulated by Gag, Pol and Nef genes introduced into target cells with vaccinia and processed through a class I pathway were responsible for the protective effect. This factor resembled CAF, the CD8+ cell antiviral factor described in Mackewicz and Levy (ARHR 8:1039, 1992)
- The CD4+ and CD8+ T-cell populations were both strongly skewed toward the CD45RO+ phenotype, many of which were terminally differentiated, CD28-, and expressed the activation markers CD38+ and HLA-DR+. Cell turnover, however, wasn't much elevated as measured by apoptosis or Ki-67+ and Bcl-2 dim expression.
- Vigorous p24-specific Th proliferative responses were observed, and 50% of CD4+ T-cells proliferated in response to p24 Gag, an extraordinary percentage. Responses were also detected against other regions in Gag, gp120 and Nef. It remains unclear how such vigorous Th responses are maintained with undetectable ongoing viral replication.
- Strong CD4+ T-cell IFNgamma Elispot responses were mapped to many peptides in Gag for this patient. T-cells from two other LTNPs were tested here, and they did not react with as many Gag peptides as the main study subject of the paper. NIH reference Gag peptide set was used, but the sequences of the reactive peptides and the precise strain was not indicated in the paper, so we could not record them in the database.
- CD8+ T cell Elispot responses to Gag, Env, Nef, and Pol were detected as well, although CTL were not prominent, consistent with undetectable viremia.
- This subject had strong NAb responses when tested using the X4 primary isolate 228 200.

T-Helper CD4+

References Zheng *et al.* 2004
- Gag, Env, Tat, and Nef-specific T-cell responses were evaluated in 68 HIV-1 and 55 HIV-2 infected drug naive, generally asymptomatic, infected Senegalese patients.
- HIV-1 peptides were derived from HIV-1 CRF-02 (HIV-1 A/G, AJ251056)and HIV-2 peptides spanning HIV-2 ROD (M15390).
- Gag specific responses dominated in both groups, but overall magnitude and frequencies did not correlate with viral load or CD4 counts. CD4+ Helper T-cell responses were found in only 8% of HIV-1 + people, but in 48% of HIV-2 + people, suggesting helper T cell responses may contribute to improved control of viremia in HIV-2 infected patients. Lower viral load was associated magnitude of T-cell responses in HIV-1 infection only when the T-cell responses were measured for cross-reactivity with HIV-2.

HXB2 Location Gag
Author Location p24
Epitope
Subtype A, AG, B
Immunogen HIV-1 infection
Species (MHC) human
Country Cote D'Ivoire
Assay type Cytokine production, CD8 T-cell Elispot - IFNγ, CD4 T-cell Elispot - IFNγ
Keywords HIV exposed persistently seronegative (HEPS)
References Jennes *et al.* 2004
- Env(gp120)- and Gag(p24)-specific T helper responses were compared between HIV-exposed seronegative (ESN) and seropositive female sex workers in Africa (Abidjan, Cote d'Ivoire).
- HIV-specific CD4+ T cells were detected in both study groups; low level EliSpot responses were found in 8/40 ESN sex workers. The presence of HIV specific CD4+ T-cells was detected by flow cytometry in 3/8 (38%) in the ESN group, was associated with the frequency and not with the duration of HIV exposure. The ESN reponses were detected in women with more clients on the previous working day and more exposures per month.
- B subtype peptides were used to probe these responses because of availability, however the predominant clades circulating in the area are A and CRF02.

HXB2 Location Gag
Author Location Gag
Epitope
Immunogen HIV-1 infection
Species (MHC) human
Country Netherlands
Assay type proliferation, Intracellular cytokine staining
References Jansen *et al.* 2006
- Functional CD4+ T cells were compared in long-term asymptomatic individuals (LTA) and progressors to AIDS. Gag-specific CD4+ T cells producing IL-2 or IFN-γ were lost in progressors late in infection.

HXB2 Location Gag

Immunogen vaccine
Vector/Type: adenovirus type 5 (Ad5) *HIV component:* Env, Gag *Adjuvant:* Cholera toxin (CT)
Species (MHC) macaque
Assay type proliferation, CD8 T-cell Elispot - IFNγ, CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining, Other
Keywords vaccine antigen design
References Mercier *et al.* 2007
- 3 rhesus macaques were given oral immunizations with an enteric-coated mixture of adenoviral vectors expressing HIV-1 gag and a string of conserved env peptides representing broadly cross-reactive CD4+ and CD8+ epitopes. The macaques were boosted intranasally with a mixture of 6 HIV-1 envelope peptides plus cholera toxin adjuvant.
- The immunizations increased cellular immune responses, including antigen-specific IFNgamma-producing CD4+ and CD8+ effector memory T cells in the intestine. After only the oral immunization, there were no EliSpot responses to env peptides or to gag. After the intranasal boost, EliSpot responses against env peptides and against inactivated HIV were markedly increased, but gag responses were not.

Epitope
Subtype B
Immunogen vaccine
Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* B clade
Species (MHC) macaque
Assay type Intracellular cytokine staining
Keywords subtype comparisons, vaccine antigen design
References Smith *et al.* 2005

- Macaques were immunized with a clade B HIV vaccine and tested for responses to pools of clade B and A/G Env and Gag peptides. While CD4 responses were more frequent than CD8 responses, higher cross-clade responses were found for CD8 responses. The authors suggest that the better cross-clade reactivity of the CD8 responses reflects the size difference between CD8 and CD4 epitopes; the smaller CD8 epitopes provide a smaller target for mutation.
- All 5 pools of B Env and Gag peptides stimulated CD4 responses, while only 2 pools of A/G peptides stimulated responses, suggesting that 1 or 2 out of 5 CD4 epitopes were cross-reactive.

HXB2 Location Gag
Author Location
Epitope
Immunogen HIV-1 infection
Species (MHC) human
Assay type Intracellular cytokine staining
Keywords acute/early infection
References Zaunders *et al.* 2005

- In 6/7 patients with very early HIV infection, CD4+ T cells producing IFN-g in response to Gag peptides were readily detected, and most CD4+ T cells were CCR5+CD38+++. In PHI subjects with later presentation, antigen specific CD4+ T cells could not be readily detected, coinciding with a lower level of CCR5+CD38+++ CD4+ T cells.

III-B-6 Protease Helper/CD4 + T-cell epitopes

Author Location RT (36–52)
Epitope `EICTEMEKEGKISKIGP`
Immunogen vaccine
Vector/Type: DNA, virus-like particle (VLP), HIV infected-cell lysate, polyepitope *HIV component:* Env, Gag, Nef, Pol
Species (MHC) human
Country Russia
Assay type T-cell Elispot
Keywords vaccine antigen design
References Bazhan *et al.* 2008

- Two immunogens were combined in the CombiHIV vac (VLP-TBI-pcDNATCI) vaccine: artificial polyepitope protein TBI, containing T- and B-cell epitopes from Env and Gag and the DNA vaccine construct pcDNA-TCI, carrying CTL and CD4+ epitopes from Env, Gag, Pol, Nef.

T-Helper CD4+

- Combination of two B- and T-cell immunogens resulted in increase in the antibody response (but not CTL response) to both TBI protein and the proteins from HIV-1 lysate, compared to the level of antibodies induced by immunization with either immunogen alone. The synergistic effect in the induction of B-cell-mediated response was explained by the presence of CD4+ T-helper epitopes in TCI, due to stimulation of B-cell proliferation and differentiation.
- EICTEMEKEGKISKIGP is a previously known epitope that is a part of this vaccine construct.

Epitope KDSWTVNDIQKLVGK
Epitope name pep23
Immunogen vaccine
Vector/Type: bacteriophage coat protein, dihydrolipoyl acetyltransferase E2 protein, of Bacillus stearothermophilus *HIV component:* RT
Species (MHC) transgenic mouse (DR)
Assay type Chromium-release assay
Keywords vaccine antigen design
References De Berardinis *et al.* 2003

- An RT T-helper (KDSWTVNDIQKLVGK) that can be promiscuously presented by multiple HLA-DR molecules, and an RT CTL epitope (ILKEPVHGV) presented by HLA-A2, were displayed using two different antigen presentation systems, bacteriophage virions or E2 protein scaffolds. Both systems enabled display of the epitopes in a mouse model system to the immune system. CTL responses were detected in immunized mice, and were processed correctly for both class I and class II presentation.

Epitope KDSWTVNDIQKLVGK
Epitope name pep23
Immunogen vaccine, in vitro stimulation or selection
Vector/Type: peptide presented on icosahedral protein scaffold *HIV component:* RT *Adjuvant:* Incomplete Freund's Adjuvant (IFA)
Species (MHC) human, transgenic mouse (DR5)
Assay type Cytokine production, T-cell Elispot, Th support of CTL response
References Domingo *et al.* 2003

- A virus-like protein scaffold, called E2DISP, derived from pyruvate dehydrogenase multienzyme from Bacillus stearothermophilus has been engineered to display 60 copies of one or more epitopes on a single molecule. An E2DISP scaffold which displayed pep23, a 15-residue B and T helper epitope from the reverse transcriptase of HIV-1 elicited a T-helper response *in vitro*.
- The E2DISP scaffold displaying pep23 to stimulate a Th responses, and peptide RT2, which is a CTL epitope from HIV-1 reverse transcriptase, was able to elicit a CD8+ T cell response *in vitro* and in a vaccinated HLA-A2 transgenic mouse. Thus the E2DISP scaffold allows cell-entry and access to the class I and class II processing pathways.
- The Th response in vaccinated mice was also able to support Pep23 specific IgG response.

Assay type proliferation
Keywords binding affinity, epitope processing, vaccine-specific epitope characteristics, escape
References Moschella *et al.* 2003

- Two helper T-cell clones specific for this epitope presented in the context of HLA-DR5-11.01 have been characterized. They have different T cell receptor usage. Residue 11 (kdswtvndiqKlvgk)is a natural variant, and K11A, K11G, K11I, and K11L variants were synthesized and studied in two presentation contexts, one as simple peptides, the other embedded in a recombinant protein, GST.

T-Helper CD4+

- The two Th clones and the two presentation contexts gave different outcomes with the peptides. K11I was not stimulatory, and was an antagonist in GST, an agonist as a peptide. K11L retained reactivity when presented in the fusion antigen, and had no activity as a peptide. K11G stimulated in both contexts, but the concentrations required for half maximal reactivity were different. K11A could not bind to the MHC in the processed form and could only stimulate when given as a peptide.
- In conclusion, substitutions in epitopes have different effects on Th stimulation depending on the mode of processing, and this should be considered when interpreting Th escape studies and vaccine development.

HXB2 Location RT (249–263)
Author Location RT (248–262)
Epitope KDSWTVNDIQKLVGK
Immunogen in vitro stimulation or selection
Species (MHC) human (DR5(11.01))
Donor MHC DR5, DR6
Assay type proliferation
Keywords binding affinity, epitope processing, vaccine-specific epitope characteristics, escape, TCR usage
References Bonomi *et al.* 2000

- Two helper T-cell clones specific for this epitope presented in the context of HLA-DR5-11.01 were characterized. One of them used TCR Vβ15, the other used Vβ2. The substitutions D2A, W4A, D8A, I9A, and K15A were generated and only D8A, I9A failed to react with one clone, while W4A, D8A, I9A were all critical for a reaction with the other clone, showing the TCRs focused on different but overlapping residues.
- Moving the epitope to different contexts in recombinant proteins for presentation by APCs, as well as adding polyanalanine and polyserine strings to either side of the epitope, influenced reactivity, suggesting processing context can influence the structure of the presentation complex.

Assay type Cytokine production, proliferation
Keywords supertype, rate of progression
References Boaz *et al.* 2003

T-Helper CD4+

- Proliferative and cytokine (IFNgamma and Il-2) immune responses to 11 previously defined (Wilson 2001), and immunodominant and broadly cross-reactive Th epitopes and to p24 overlapping peptides were characterized in 10 LTNPs (chronically infected, asymptomatic, long term non-progressors, CD4+ T cells >500 after 15 years) and 7 SPs (slow progressors, CD4+ T cell declined to <500 after 15 years. Patients were treatment-naive.
- Gag-specific CD4+ T cells in LTNPs showed increased numbers of IFN gamma and IL-2 producing cells compared to SPs. Cytokine production and proliferative responses were negatively correlated with the viral load and positively correlated with the CD4+ T cell count. IL-2, but not IFNgamma, levels were correlated with proliferation.
- Pol3 was 1 of 2 peptides that had a positive correlation between absolute number and percentage of responding cells and viral load. Pol3 responses were also negatively correlated with CD4 counts. In contrast, the absolute number of 3/11 peptides studied were negatively correlated with viral load.

References Livingston *et al.* 2002

- 4 Th HIV epitopes presented by HLA-DR molecules were identified that also could be presented by murine class II molecule I-Ab, enabling testing of vaccine strategies in H-2b mice.
- Responses to pooled peptides, polyepitope peptides in a linear construct or in a branched MAP construct, and a DNA polyepitope construct with a CMV promoter were compared. A linear arrangement in polyepitope construct created a junctional epitope that could be disrupted with the addition of GPGPG spacers. The linear polyepitope construct with the GPGPG spacer worked well in terms of eliciting responses to all 4 peptides, using either DNA or protein for the vaccination.
- Although responses to this peptide indicated it was immunodominant, responses to all 4 peptides were made upon vaccination with linear constructs when GPGPG spacers were used.

Patients were treatment-naive.
- Gag-specific CD4+ T cells in LTNPs showed increased numbers of IFN gamma and IL-2 producing cells compared to SPs. Cytokine production and proliferative responses were negatively correlated with the viral load and positively correlated with the CD4+ T cell count. IL-2, but not IFNgamma, levels were correlated with proliferation.
- Pol6 was 1 of 3 peptides that had a negative correlation between absolute number of responding cells and viral load.

Immunogen HIV-1 infection
Species (MHC) human
Country United States
Assay type CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining, HLA binding
Keywords supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection
References Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN-γ EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 11% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNPs responded to many peptides, comparable to acute STI.

Epitope
Immunogen vaccine
Vector/Type: DNA *Strain:* B clade MN *HIV component:* Env, Gag, Pol *Adjuvant:* CD80, CD86
Species (MHC) chimpanzee
References Kim *et al.* 1998

- Co-stimulatory molecules co-expressed with an HIV-1 immunogen in a DNA vaccine used to enhance the immune response – co-expression of CD86, but not CD80, dramatically increased both HIV Env and Gag/Pol specific CTL and Th proliferative responses.

HXB2 Location Pol
Author Location Pol
Epitope
Immunogen HIV-1 infection
Species (MHC) human
Keywords HAART, ART
References Blankson *et al.* 2001

- 5/10 chronically HIV infected patients with low CD4+ counts who received HAART therapy and experienced immune reconstitution displayed p24, p17 and p66 T-helper CD4 proliferative responses, in contrast to 0/8 chronically HIV infected patients with high CD4+ counts at the initiation of antiretroviral treatment.
- This surprising result could be due to the low CD4 nadir patients being more likely to have thymic regeneration or a peripheral expansion of T cells.

HXB2 Location Pol
Author Location p66
Epitope
Immunogen HIV-1 infection
Species (MHC) human
Keywords HAART, ART
References Oxenius *et al.* 2000

- Patients who started therapy at acute HIV infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable.

HXB2 Location Pol
Author Location p66
Epitope
Immunogen HIV-1 infection
Species (MHC) human
Keywords HAART, ART
References Palmer *et al.* 2002

- CD4+ T cell proliferative responses from 33 HIV-1 infected patients with HAART suppression were compared to 19 patients with active viral replication (HAART failures and HAART naive). Patients with HAART suppression showed stronger p24- and p66-specific proliferative responses compared to patient groups with active HIV-1 replication, suggesting active viral replication *in vivo* specifically reduces proliferation responses.
- No differences in the frequency of HIV-specific CD4+ T-cells that were positive for cytokine secretion in a flow cytometry assay were found in the HAART suppressed group versus the group with active viral replication.

HXB2 Location Pol
Author Location (BRU)

Keywords binding affinity, computational epitope prediction, cross-presentation by different HLA
References Fonseca *et al.* 2006

- TEPITOPE algorithm was used to screen the most conserved regions of clade B consensus sequence for multiple HLA-DR binding epitopes. Peptides predicted to bind 16 or more HLA-DR molecules were synthesized and further assessed in binding assays and for T-cell recognition in a cohort of 32 brazilian HIV-1 chronically infected individuals.
- While the reacting peptide was EAIIRILQQLLFIHF, shorter IRILQQLLF peptide was predicted by TEPITOPE to bind HLA-DR molecules. Flanking amino acids were added to increase the efficiency of in vitro peptide presentation to CD4 T cells.

HXB2 Location Vpr (60–82)

Species (MHC) mouse
Donor MHC H-2d
Assay type proliferation, CD4 T-cell Elispot - IFNγ
Keywords Th1, vaccine antigen design
References Ramakrishna *et al.* 2004

- BALB/c and C57BL/6 mice were intramuscularly immunized with a codon optimized HIV-1 C-consensus Tat DNA vaccine that was linked to ubiquitin to facilitate rapid processing. Ubiquitin and codon optimization enhanced Th1 T cell responses, with increased proliferative responses, cytotoxic responses, and Th1 responses measured by IFNgamma EliSpot, but not the Th2 responses, measured by IL-4 EliSpot..
- Several immunogenic regions in HIV-1 Tat were identified in BALB/c mice using EliSpot. The strongest immune response was within the core region of Tat; the peptides based on the C subtype consensus positions 30-50 and 40-60 gave the strongest EliSpot responses in BALB/c mice, suggesting a putative helper T-cell epitope spanning the region of overlap, residues 40-50.

Epitope
Subtype B
Immunogen in vitro stimulation or selection
Species (MHC) human
Keywords epitope processing, vaccine-specific epitope characteristics, dendritic cells, Th1
References Fanales-Belasio *et al.* 2002b

- Biologically active HIV-1 Tat is readily taken up by monocyte-derived dendritic cells (MDDC) (and activated endothelial cells), but not other APCs. Tat must be in a native, non-oxidized conformation for efficient uptake. Tat upregulates MHC molecules, IL-12, TNFα, RANTES and MIP-1-α and MIP-1-β production which drives Th1 immune responses and enhances antigen presentation.
- Native Tat enhanced the antigen presentation of MDDC and boosted proliferative recall and allogeneic antigen responses, and the authors propose it could be used as an adjuvant to drive the immune response as well as an antigen.

References Fanales-Belasio *et al.* 2002a

- HIV-1 Tat protein has several virtues vaccine component. It is an early expressed protein, and though variable, contains consverved T-cell and B-cell epitopes that allow cross-clade recognition. It is efficiently taken up by monocyte-derived dendritic cells (MDDCs) and in this context can stimulate Th1 immune responses. A Tat based vaccine can elicit an immune response that can control primary infection in monkeys that are in early stage of in infection with SHIV89.6P.

Assay type CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining, HLA binding
Keywords supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection
References Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN-γ EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 11% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNPs responded to many peptides, comparable to acute STI.

Epitope
Immunogen vaccine
Vector/Type: DNA *HIV component:* Rev
Species (MHC) mouse
Keywords HAART, ART
References Chan *et al.* 1998

- Rev M10 is a construct that was introduced into mice through a genetic vaccination.
- Rev was used to test for down-regulation of HIV-1 in infected cells as a method for gene therapy – in the course of this study, Rev-specific IL-2 producing Th cells developed in the mice.

HXB2 Location Rev
Author Location Rev
Epitope
Immunogen vaccine
Vector/Type: DNA *HIV component:* Nef, Rev, Tat
Species (MHC) human
Keywords HAART, ART
References Calarota *et al.* 1999

- 9/9 HIV-1 + subjects were given one of three DNA vaccinations for nef, rev or tat, and novel proliferative and CTL responses were generated.
- The nef DNA immunization induced the highest and most consistent CTLp activity, IFN-γ production, and IL-6 and IgG responses.
- Highly active antiretroviral treatment (HAART) did not induce new HIV-specific CTL responses but reduced viral load, while DNA vaccination induced new immune responses but did not reduce viral load – thus this is a potentially complementary and promising combination.

HXB2 Location Rev
Author Location Rev
Epitope
Immunogen HIV-1 infection, vaccine
Vector/Type: DNA *HIV component:* Nef, Rev, Tat *Adjuvant:* CpG immunostimulatory sequence (ISS)
Species (MHC) human
Keywords review, Th1
References Calarota & Wahren 2001

- This review discusses the cellular immune response, and comments on CpG induction of Th1 cytokines and enhanced immune responses, and HIV-1 DNA vaccine boosting of CTL and Th proliferative responses in asymptomatic HIV+ individuals.

HXB2 Location Rev
Author Location Rev
Epitope
Immunogen vaccine
Vector/Type: DNA with CMV promotor *Strain:* B clade MN *HIV component:* Env, Rev *Adjuvant:* Bupivacaine
Species (MHC) human
Keywords early-expressed proteins
References MacGregor *et al.* 2002

- A phase I clinical trial of a HIV-1 Env and Rev DNA vaccine with a CMV promoter was conducted and Th proliferative, CTL and Elispot responses monitored. The construct was modified for safety and included no LTRs or packaging signals. The vaccine strategy was safe, and elicited strong CD4-T cell responses, but not CD8 T-cell responses. Rev elicited strong Th responses, and is a early produced protein so may confer advantages.
- With a 300 ug dose, 4/6 individuals had a lymphocyte proliferation (LP) responses to gp120, 3/6 to Rev.
- With a 1000 ug dose, 4/6 individuals had a LP and 2/6 had IFNgamma Elispot responses to gp160; 3/6 had LP, and 4/6 had IFNgamma Elispot responses to Rev.
- No responses to three specific CTL epitopes were observed by Elispot in individuals with appropriate HLA. Some cytotoxic activity against whole protein was observed that was CD4+ T-cell mediated.

III-B-15 Vpu Helper/CD4+ T-cell epitopes

HXB2 Location Vpu (6–20)
Author Location Vpu (6–20 clade B consensus)
Epitope `VLAIVALVVATIIAI`
Subtype B
Immunogen HIV-1 infection, computer prediction
Species (MHC) human
Country Brazil
Assay type CD4 T-cell Elispot - IFNγ, HLA binding
Keywords binding affinity, computational epitope prediction, cross-presentation by different HLA
References Fonseca *et al.* 2006

- TEPITOPE algorithm was used to screen the most conserved regions of clade B consensus sequence for multiple HLA-DR binding epitopes. Peptides predicted to bind 16 or more HLA-DR molecules were synthesized and further assessed in binding assays and for T-cell recognition in a cohort of 32 brazilian HIV-1 chronically infected individuals.

HXB2 Location Vpu (19–34)
Author Location Vpu (19–34)
Epitope `AIVVWSIVLIEYRKIL`
Immunogen HIV-1 infection

T-Helper CD4+

Species (MHC) human
References Ranki *et al.* 1997
- T-cell response to this epitope persisted after seroreversion.

HXB2 Location Vpu (20–41)
Author Location
Epitope AIWWSIVFIEYRKILRQRKIDR
Epitope name HIV-VAX-1056
Immunogen HIV-1 infection
Species (MHC) human (DRB*0101)
Country United States
Assay type CD4 T-cell Elispot - IFNγ
Keywords subtype comparisons, computational epitope prediction, vaccine antigen design
References De Groot *et al.* 2005
- 9-mers conserved across clades were analyzed by computer for affinity to DRB*0101. 23-mers were synthesized based on these predicted epitopes. 19/20 of these 23-mers were confirmed to be immunogenic in US HIV-infected subjects.
- 1/13 US test subjects responded to this 23-mer by CD4 EliSpot assay. The core computer-predicted peptide was VFIEYRKIL.

HXB2 Location Vpu
Author Location Vpu
Epitope
Immunogen vaccine
Vector/Type: DNA *HIV component:* Nef, Vif, Vpu
Species (MHC) mouse (H-2^d)
Keywords subtype comparisons, Th1
References Ayyavoo *et al.* 2000
- Splenocytes from BALB/c mice immunized with pVVN-P DNA were incubated with Vif, Vpu or Nef antigens for 3 days and assayed for IL-4 and IFN-γ levels.
- Antigen stimulation increased IFN-γ production in pVVN-P immunized mice, indicating a Th1 response.
- IL-4 production was not significantly changed after antigen stimulation compared to control levels.
- Cross-clade CTL activity was also observed: A, B clade, CRF01(AE) clade antigens could serve as targets for the B clade immunization stimulated CTL – an HIV-1 AC recombinant, however, did not stimulate a CTL response, but was expressed at lower levels on the target cell.

III-B-16 gp160 Helper/CD4+ T-cell epitopes

HXB2 Location gp160 (19–31)
Author Location gp160 (19–31 clade B consensus)
Epitope TMLLGMLMICSAA
Subtype B
Immunogen HIV-1 infection, computer prediction
Species (MHC) human (DRB1*0101, DRB1*0405, DRB1*1101)
Country Brazil
Assay type CD4 T-cell Elispot - IFNγ, HLA binding
Keywords binding affinity, computational epitope prediction, cross-presentation by different HLA
References Fonseca *et al.* 2006
- TEPITOPE algorithm was used to screen the most conserved regions of clade B consensus sequence for multiple HLA-DR binding epitopes. Peptides predicted to bind 16 or more HLA-DR molecules were synthesized and further assessed in binding assays and for T-cell recognition in a cohort of 32 brazilian HIV-1 chronically infected individuals.
- While the reacting peptide was TMLLGMLMICSAA, shorter MLLGMLMICSA peptide was predicted by TEPITOPE to bind HLA-DR molecules. Flanking amino acids were added to increase the efficiency of in vitro peptide presentation to CD4 T cells.

HXB2 Location gp160 (30–51)
Author Location gp120 (30–51 IIIB)
Epitope ATEKLWVTVYYGVPVWKEATTT?
Epitope name A1
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
References Geretti *et al.* 1994
- Th proliferative responses were studied in 36 asymptomatic HIV-1 + patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools.
- After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders.
- IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation.
- 2/15 responders recognized this peptide, mean SI = 4.6.

HXB2 Location gp160 (31–45)
Author Location Env (31–45 HXB2)
Epitope TEKLWVTVYYGVPVW
Subtype B
Immunogen in vitro stimulation or selection
Species (MHC) human (DP4)
Assay type CD4 T-cell Elispot - IFNγ, HLA binding
Keywords binding affinity, epitope processing, computational epitope prediction, dendritic cells
References Cohen *et al.* 2006
- Motif-based quantitative matrices binding predictions, binding assays and cellular assays were used to identify 4 HLA-DP4 epitopes by scanning the whole HIV-1 genome.
- 21 peptides were predicted to bind HLA-DP4, 17 of them did bind in binding assays, 6 of them were good binders. Of the 6 good binders, 4 peptides primed peptide-specific CD4+ T cell lines restricted to HLA-DP4 molecules.

HXB2 Location gp160 (31–48)
Author Location Env
Epitope VGLNWVTVYYGVPVWKEA
Subtype C
Immunogen vaccine

T-Helper CD4+

Vector/Type: vaccinia, modified vaccinia Ankara (MVA), poxvirus, DNA prime with poxvirus boost, attenuated poxvirus vector NYVAC *Strain:* C clade 97CN54 *HIV component:* Env, Gag, Nef, Pol
Species (MHC) human
Country Switzerland
Assay type proliferation, CD8 T-cell Elispot - IFNγ, Other
Keywords vaccine-induced epitopes, vaccine antigen design
References Harari *et al.* 2008

- A poxvirus based vaccine against HIV-1 subtype C was characterized and found to be efficacious. DNA prime, NYVAC boost vaccine containing Env, Gag, Pol, and Nef as a polypeptide immunogen elicited T-cell responses in 90% vaccinees.
- Vaccine induced T-cell response was of a high magnitude and polyfunctional with respect to CD4 and CD8 cell activation. Each responding vaccinee elicited broad responses to multiple epitopes, especially in Env, that persisted.
- A CD4 helper Env epitope, previously described as VYYGVPVWKEA, and found within peptides VGLNWVTVYYGVPVWKEA and WVTVYYGVPVWKGAT elicited immune response.
- 9 novel Env epitopes, both CTL and helper, were found to be targeted after vaccination in subjects.

HXB2 Location gp160 (31–50)
Author Location gp120 (30–49 89.6)
Epitope KEKTWVTIYYGVPVWREATT
Immunogen HIV-1 infection
Species (MHC) human
Country United States
Assay type CD4 T-cell Elispot - IFNγ
Keywords immunodominance, structure
References Mirano-Bascos *et al.* 2008

- This study presents helper T-cell epitope mapping data on 7 HIV patients, performed with 47 overlapping 20-mer peptides spanning gp120 sequence, strain 89.6.
- Immunodominance patterns measured as either the number of IFN-γ producing cells or the number of responding individuals, were similar to the immunodominance patterns previously described in mice, and correlated to the structure of the protein antigen.
- Epitopes were found adjacent to flexible protein regions and variable sequences. Immunodominant epitopes were found to be located primarily in the outer domain, an average of 12 residues C-terminal to flexible loops. In the less immunogenic inner domain, epitopes were found an average of five residues N-terminal to conserved regions of the protein, once again placing the epitopes C-terminal to flexible loops.
- 2 out 7 individuals responded to this peptide.

HXB2 Location gp160 (32–44)

Vector/Type: DNA, virus-like particle (VLP), HIV infected-cell lysate, polyepitope *HIV component:* Env, Gag, Nef, Pol
Species (MHC) mouse (H-2^{d})
Country Russia
Assay type T-cell Elispot
Keywords vaccine antigen design
References Bazhan *et al.* 2008

- Two immunogens were combined in the CombiHIV vac (VLP-TBI-pcDNATCI) vaccine: artificial polyepitope protein TBI, containing T- and B-cell epitopes from Env and Gag and the DNA vaccine construct pcDNA-TCI, carrying CTL and CD4+ epitopes from Env, Gag, Pol, Nef.
- Combination of two B- and T-cell immunogens resulted in increase in the antibody response (but not CTL response) to both TBI protein and the proteins from HIV-1 lysate, compared to the level of antibodies induced by immunization with either immunogen alone. The synergistic effect in the induction of B-cell-mediated response was explained by the presence of CD4+ T-helper epitopes in TCI, due to stimulation of B-cell proliferation and differentiation.
- GVPVWKEATTTLFCASDAKA is a previously known epitope that is a part of TCI fragment TVYYGVPVWKEATTTLFCASDAKAY in this vaccine construct.

Immunogen HIV-1 infection
Species (MHC) human (DR)
Assay type Cytokine production, proliferation, CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords HAART, ART, acute/early infection, cross-presentation by different HLA
References Malhotra *et al.* 2003

- 92 acute- or early-HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymophoproliferative capacity, not viral escape.

T-Helper CD4+

Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy.
- This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail. The CD4+ clones showed MHC-restricted cytotoxicity and secreted high levels of cytokines when stimulated. These Th reponses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintained in Env.
- This peptide showed bound to HLA-DRB1*0101.

HXB2 Location gp160 (65–75)
Author Location gp120 (72–82)
Epitope AHKVWATHACV
Immunogen vaccine
Vector/Type: peptide
Species (MHC) mouse (H-2^{bxk}, H-2^{sxd})
References Sastry & Arlinghaus 1991
- Peptides induced T-cell proliferative response to immunizing peptide and to gp160.

HXB2 Location gp160 (71–85)
Author Location Env
Epitope THACVPADPNPQEMV
Subtype C
Immunogen vaccine
Vector/Type: vaccinia, modified vaccinia Ankara (MVA), poxvirus, DNA prime with poxvirus boost, attenuated poxvirus vector NYVAC *Strain:* C clade 97CN54 *HIV component:* Env, Gag, Nef, Pol
Species (MHC) human
Country Switzerland
Assay type proliferation, CD8 T-cell Elispot - IFNγ, Other
Keywords vaccine-induced epitopes, vaccine antigen design
References Harari *et al.* 2008
- A poxvirus based vaccine against HIV-1 subtype C was characterized and found to be efficacious. DNA prime, NYVAC boost vaccine containing Env, Gag, Pol, and Nef as a polypeptide immunogen elicited T-cell responses in 90% vaccinees.
- Vaccine induced T-cell response was of a high magnitude and polyfunctional with respect to CD4 and CD8 cell activation. Each responding vaccinee elicited broad responses to multiple epitopes, especially in Env, that persisted.
- A CD4 helper Env epitope, previously described as CVPTDPNPQEW, and found within peptide THACVPADPNPQEMV elicited immune response.
- 9 novel Env epitopes, both CTL and helper, were found to be targeted after vaccination in subjects.

HXB2 Location gp160 (74–85)
Author Location gp120 (81–92)
Epitope CVPTNPVPQEVV
Immunogen vaccine
Vector/Type: peptide
Species (MHC) mouse (H-2^{bxk}, H-2^{sxd})
References Sastry & Arlinghaus 1991
- Peptides induced T-cell proliferative response to immunizing peptide and to gp160.

HXB2 Location gp160 (74–85)
Author Location gp120 (74–85 LAI)
Epitope CVPTDPNPQEVV
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
References Schrier *et al.* 1989
- Stimulates T-cell proliferation in HIV-infected donors.

HXB2 Location gp160 (80–99)
Author Location gp120 (51–70 HXB2)
Epitope NPQEVVLVNTENFNMWKND
Subtype B
Immunogen in vitro stimulation or selection
Species (MHC) human
Keywords TCR usage
References Li Pira *et al.* 1998
- Clonal heterogeneity was broad for a recall response to tetanus toxoid or PPD, but oligoclonal to primary HIV antigens, dominated in this case by TCR Vβ 13 usage.
- Donor of PBMC that recognized this epitope had HLA-DR alleles 2 and 7.

HXB2 Location gp160 (81–100)
Author Location gp120 (80–99 89.6)
Epitope PQEVVLGNVTENFNMWKNNM
Immunogen vaccine
Vector/Type: protein *Strain:* B clade 89.6 *HIV component:* gp120 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72)
Species (MHC) mouse (H-2^{k})
Keywords immunodominance
References Dai *et al.* 2001
- Promiscuous immunodominant epitopes in gp120 were mapped by overlapping peptides in CBA/J H-2^{k} and BALB/c H-2^{d} mice, and all were found to be in the outer domain, proximal to regions of structural disorder indicated by the crystal structure or by sequence divergence.
- This peptide was recognized by 10/10 CBA/J with an average SI of 8.2, and not by BALB/c mice, so is considered to be uniquely immunodominant for H-2^{k}
- Uniquely immunodominant sequences tended to be in the inner domain of the protein.

HXB2 Location gp160 (81–100)
Author Location gp120 (80–99 89.6)
Epitope PQEVVLGNVTENFNMWKNNM
Epitope name Peptide 6
Immunogen vaccine
Vector/Type: protein *Strain:* B clade 89.6 *HIV component:* gp120 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72)
Species (MHC) mouse
Donor MHC H-2k
Keywords epitope processing, immunodominance
References Dai *et al.* 2001

T-Helper CD4+

- Helper T-cell proliferative responses to gp120 vaccines in 2 mouse strains, CBA/J and BALB/c, were mapped using 47 overlapping peptides that span gp120. Promiscuously immunodominant peptides were identified in both mice strains that were located in the outer domain of gp120 and were associated with regions of local structural disorder in proximal N-terminal segments, suggesting 3-D protein structure influences Th antigen processing and the frequency of immunogenic sequences.
- This peptide was not reactive in any BALB/c mice tested (0/10), but was highly reactive in all (10/10) CBA/J mice.

HXB2 Location gp160 (81–100)
Author Location gp120 (80–99 89.6)
Epitope PQEVVLGNVTENFNMWKNNM
Immunogen HIV-1 infection
Species (MHC) human
Country United States
Assay type CD4 T-cell Elispot - IFNγ
Keywords immunodominance, structure
References Mirano-Bascos *et al.* 2008

- This study presents helper T-cell epitope mapping data on 7 HIV patients, performed with 47 overlapping 20-mer peptides spanning gp120 sequence, strain 89.6.
- Immunodominance patterns measured as either the number of IFN-γ producing cells or the number of responding individuals, were similar to the immunodominance patterns previously described in mice, and correlated to the structure of the protein antigen.
- Epitopes were found adjacent to flexible protein regions and variable sequences. Immunodominant epitopes were found to be located primarily in the outer domain, an average of 12 residues C-terminal to flexible loops. In the less immunogenic inner domain, epitopes were found an average of five residues N-terminal to conserved regions of the protein, once again placing the epitopes C-terminal to flexible loops.
- 1 out 7 individuals responded to this peptide.

HXB2 Location gp160 (81–101)
Author Location gp120 (81–101 IIIB)
Epitope PQEVVLVNVTENFNMWKNDMV?
Epitope name B1
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
References Geretti *et al.* 1994

- Th proliferative responses were studied in 36 asymptomatic HIV-1 + patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools.
- After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders.
- IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation.
- 2/15 responders recognized this peptide, mean SI = 5.1.

HXB2 Location gp160 (87–101)
Author Location Env
Epitope ENVTENFNMWKNEMV
Subtype C

References Kuhn *et al.* 2001a

- In a S. African perinatal transmission study, 33% (33/86) of cord blood samples from infants with seropositive mothers produced T-helper responses (measured by a bioassay measuring IL2 production in a murine cell line and confirmed with a proliferation assay) against a peptide cocktail containing Th epitopes P18 MN, P18 IIIB, T1, T2, and TH4.
- The mothers were predominantly infected with subtype C, but the T help response was detectable in a number of cord blood samples despite using peptides based on B subtype reagents.
- 3/33 infants with cord blood T help responses to Env were infected *in utero*, 2/33 were lost to follow up, and 28/33 were not infected. 6/53 of the infants with cord blood that was unresponsive to Env peptide stimulation were infected before delivery, and 8/47 contracted HIV intrapartum or via breast-feeding.
- Measurable HIV specific T help responses elicited in the immunologically immature newborn, possibly in response to *in utero* exposure, are associated with a protective natural immunity that helps block mother-infant transmission of HIV-1.

References Clerici *et al.* 1994b

- IL-10-specific mRNA was upregulated in PBMC from asymptomatic, HIV-infected (HIV+) patients, and was particularly high in those with severely compromised Th cells function. Th response to HIV peptides *in vitro* could be restored by IL-10 Ab.

HXB2 Location gp160 (105–117)
Author Location Env (112–124)
Epitope HEDIISLWDQSLK
Epitope name T2
Immunogen HIV-1 infection
Species (MHC) human
Assay type proliferation
Keywords responses in children, mother-to-infant transmission
References Kuhn *et al.* 2001b

- T helper proliferative responses in cord blood at delivery to a cocktail of HIV envelope peptides were infrequent (1/41) among infants whose HIV-positive mothers received antiretroviral prophylaxis at delivery to prevent transmission. Responses were 10 times more frequent among infants of HIV-seropositive women who had no antiretroviral treatment (7/29). Reductions of HIV-specific responses occurred despite persistance of detectable HIV RNA in the mothers at delivery.
- The reduction of Th responses in newborns raises the possibility that anti-retrovial exposure during pregnancy may block subsequent immune protection. The authors point two relevant citations that showed ARV exposed infants had a more rapid course of progression (Kuhn *et al.*, JID 182:104 (2000)), but were at no greater risk of infection due to subsequent breast feeding (Ditrame *et al.*, Lancet 354:2050 (1999)).

Immunogen vaccine
Vector/Type: DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)
Species (MHC) mouse (H-2 IA^{b})
Keywords subtype comparisons, epitope processing, TCR usage
References Surman *et al.* 2001

- This epitope is located in the V2 region of UG92005 (UG, clade D) and the hybridoma that recognized it used Vβ5.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^{b} transfected L cells as targets and Vβ usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA^{b} restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

Keywords HAART, ART, acute/early infection
References Malhotra *et al.* 2003
- 92 acute- or early-HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymophoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy.
- This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail.These Th reponses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintained in Env.

Epitope `VKKEYALFNRLDVVPIENTN`
Immunogen HIV-1 infection
Species (MHC) human
Country United States
Assay type CD4 T-cell Elispot - IFNγ
Keywords immunodominance, structure
References Mirano-Bascos *et al.* 2008
- This study presents helper T-cell epitope mapping data on 7 HIV patients, performed with 47 overlapping 20-mer peptides spanning gp120 sequence, strain 89.6.
- Immunodominance patterns measured as either the number of IFN-γ producing cells or the number of responding individuals, were similar to the immunodominance patterns previously described in mice, and correlated to the structure of the protein antigen.
- Epitopes were found adjacent to flexible protein regions and variable sequences. Immunodominant epitopes were found to be located primarily in the outer domain, an average of 12 residues C-terminal to flexible loops. In the less immunogenic inner domain, epitopes were found an average of five residues N-terminal to conserved regions of the protein, once again placing the epitopes C-terminal to flexible loops.
- 2 out 7 individuals responded to this peptide.

Epitope name C5
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Keywords immunodominance
References Geretti *et al.* 1994

- Th proliferative responses were studied in 36 asymptomatic HIV-1 + patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools.
- After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 nonresponders.
- IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation.
- Five peptides were recognized most frequently: C2 (aa 142-161), C3 (aa 152-171), C5 (aa 172-191), E5 (aa 272-291) and G4 (aa 380-393). The first three were in or near V2, the other two were proximal to the V3 and V4 loops.
- 4/15 responders recognized this immunodominant peptide, average SI = 7.4.

Epitope LFYKLDVVQIDNSTN
Immunogen vaccine
Vector/Type: DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)
Species (MHC) mouse (H-2 IA^b)
Keywords subtype comparisons, epitope processing, TCR usage
References Surman *et al.* 2001

- This epitope is located in the V2 region of UG92005 (UG, clade D) and the Vβ usage of the TCR was not determined.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.

T-Helper CD4+

- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

Immunogen vaccine
Vector/Type: DNA prime with protein boost *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140
Species (MHC) mouse
Assay type Cytokine production
Keywords epitope processing
References Sealy *et al.* 2008

- Murine hybridomas with known Env peptide specificities were tested for IL-2 production following stimulation with autologous splenocytes exposed to HIV-1-infected CXCR4 GHOST cells. Hybridomas were originally derived from C57BL/6 mice immunized with a prime-boost regimen. Antigen-processing potentials in the mouse system were studied.
- The presence of a target sequence within HIV-1 did not ensure T-cell reactivity. Subtype of immunogen used to elicit T-cell reactivity also did not predict T-cell responsiveness.
- ITQACPKVSFEPIPI was the target sequence for hybridoma 1007P1-22.1 and the sequence was identical to HIV-1 pNL43 sequence infecting GHOST cells. The hybridoma was responsive to ITQACPKVSFEPIPI.
- ITQACPKVSFEPIPI was located in the vicinity of two antiparallel beta sheets. Further mapping of hybridoma target epitopes showed that hybridoma 1007P1-22.1 responded to peptides containing the QACPKVSFEP or QACPKITFEP sequence.

Epitope PKVSFEPIPIHYCAP
Immunogen vaccine
Vector/Type: DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)
Species (MHC) mouse (H-2 IA^b)
Keywords subtype comparisons, epitope processing
References Surman *et al.* 2001

- This epitope is located in the C2 region of 1007 (US, clade B) and 12 hybridomas recognized the peptide with Vβ usage of Vβ4,6,7,8.1-2,8.3,11,12 and others not determined.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

Assay type Cytokine production, CD4 T-cell Elispot - IFNγ
Keywords vaccine-induced epitopes, variant cross-recognition or cross-neutralization, vaccine antigen design
References Zhan *et al.* 2004

- To develop a polyvalent Env vaccine, subtype specific B and D T-helper epitopes were identified, and mixtures of strain 1007, clade B, or UG92005, clade D envelopes were given to C57BL/6J mice. Mice were intramuscularly immunized with recombinant DNA, then intraperitoneally with rVV and finally with env protein in CFA. A dilution of 1/100 could still elicit type specific responses, and responses persisted with different prime boost combinations.
- Priming with 1007 and UG92005 env's induced both Env-specific (SNNTVGNPIILPCRI and AMYAPPIAGLIQCSS) and cross-reactive (PKVSFEPIPIHYCAP, C2, GNIRQAHCNVSKAKW, V3-C3) Th responses in murine spleen cells.

T-Helper CD4+

References Harari *et al.* 2008

- A poxvirus based vaccine against HIV-1 subtype C was characterized and found to be efficacious. DNA prime, NYVAC boost vaccine containing Env, Gag, Pol, and Nef as a polypeptide immunogen elicited T-cell responses in 90% vaccinees.
- Vaccine induced T-cell response was of a high magnitude and polyfunctional with respect to CD4 and CD8 cell activation. Each responding vaccinee elicited broad responses to multiple epitopes, especially in Env, that persisted.
- A CD4 helper Env epitope, PKVSFEPIPIHYCAPAG-FAILKCNN was found within peptides PKVTFDPIPIHYCTP and FDPIPIHYCTPAGYA and elicited immune response.
- 9 novel Env epitopes, both CTL and helper, were found to be targeted after vaccination in subjects.

Species (MHC) guinea pig
Keywords vaccine-specific epitope characteristics, Th1
References Chattergoon *et al.* 2002

- Hartley guinea pigs were intradermally injected with either recombinant protein or plasmid expressed gp120 and monitored for delayed type hypersensivity (DTH) responses after vaccination, which are related to Th1 T-cell responses. CFA did not augment responses in animals vaccinated with plasmid.
- A total of 7 gp120 peptides elicited a delayed type hypersensivity (DTH) response after vaccination, out of a set of 60 overlapping peptides that spanned gp120. The vaccine delivery system, DNA versus rec protein, resulted in the recognition of distinct peptides.
- 5/5 animals vaccinated with rec gp120 responded by DTH to this peptide, as did 2/6 vaccinated with plasmid gp120 DNA.

References Dai *et al.* 2001

- Helper T-cell proliferative responses to gp120 vaccines in 2 mouse strains, CBA/J and BALB/c, were mapped using 47 overlapping peptides that span gp120. Promiscuously immunodominant peptides were identified in both mice strains that were located in the outer domain of gp120 and were associated with regions of local structural disorder in proximal N-terminal segments, suggesting 3-D protein structure influences Th antigen processing and the frequency of immunogenic sequences.
- This peptide was reactive in 6/10 BALB/c mice tested, and in 6/10 CBA/J mice.

Country United States
Assay type CD4 T-cell Elispot - IFNγ
Keywords immunodominance, structure
References Mirano-Bascos *et al.* 2008

- This study presents helper T-cell epitope mapping data on 7 HIV patients, performed with 47 overlapping 20-mer peptides spanning gp120 sequence, strain 89.6.
- Immunodominance patterns measured as either the number of IFN-γ producing cells or the number of responding individuals, were similar to the immunodominance patterns previously described in mice, and correlated to the structure of the protein antigen.
- Epitopes were found adjacent to flexible protein regions and variable sequences. Immunodominant epitopes were found to be located primarily in the outer domain, an average of 12 residues C-terminal to flexible loops. In the less immunogenic inner domain, epitopes were found an average of five residues N-terminal to conserved regions of the protein, once again placing the epitopes C-terminal to flexible loops.
- 2 out 7 individuals responded to this epitope.

T-Helper CD4+

References Malhotra *et al.* 2003

- 92 acute- or early-HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymophoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy.
- This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail. The CD4+ clones showed MHC-restricted cytotoxicity and secreted high levels of cytokines when stimulated. These Th reponses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintained in Env.
- Seven out of 12 clones recognized this conserved C3 region of gp120. Clone one was mapped to the optimal epitope and was found to be presented by HLA-DR. The peptide showed promiscuous binding to DRB1*0101, DRB1*0401, DRB1*1302, DRB1*0701, DRB1*0901, DRB4*0101, DRB5*0101.

References Zhan *et al.* 2003

- A very narrow Th response was stimulated in C57BL/6 mice vaccinated with vaccinia expressed HIV-1 env clone 1035. Five of seven different Th hybridomas isolated from five immunized mice immunized reacted with the peptide PKVSFEPIPIHYCAP, located in the C2 region of gp120. TCR Vβ usage indicated each of the clones was unique. Splenic populations from other C57BL/6 mice immunized with 1035 env confirmed that the gp120 specific T-helper response was focused on the PKVSFEPIPIHYCAP peptide. The authors suggest the protein structural context may contribute to the immunodominance of this peptide.
- The minimal epitope was mapped for one of the hybridomas, and was FEPIPIHYC.
- The natural variant, fDpipihyc, did not stimulate a response in three of the hybridomas.

- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

Epitope CVPAGFAMLKCNNKTFNGSG
Immunogen HIV-1 infection
Species (MHC) human
Country United States
Assay type CD4 T-cell Elispot - IFNγ
Keywords immunodominance, structure
References Mirano-Bascos *et al.* 2008

- This study presents helper T-cell epitope mapping data on 7 HIV patients, performed with 47 overlapping 20-mer peptides spanning gp120 sequence, strain 89.6.
- Immunodominance patterns measured as either the number of IFN-γ producing cells or the number of responding individuals, were similar to the immunodominance patterns previously described in mice, and correlated to the structure of the protein antigen.
- Epitopes were found adjacent to flexible protein regions and variable sequences. Immunodominant epitopes were found to be located primarily in the outer domain, an average of 12 residues C-terminal to flexible loops. In the less immunogenic inner domain, epitopes were found an average of five residues N-terminal to conserved regions of the protein, once again placing the epitopes C-terminal to flexible loops.
- 1 out 7 individuals responded to this peptide.

HXB2 Location gp160 (220–234)
Author Location gp120 (225–240 SF2)
Epitope PAGFAILKCNNKTFN
Immunogen in vitro stimulation or selection
Species (MHC)
References Manca *et al.* 1993

- T-cell line derived from unprimed, uninfected individual.
- Responds to APC pulsed with either synthetic peptide or gp120.
- Human MAbs 448-D and 450-D enhance APC gp120 uptake and presentation.

HXB2 Location gp160 (220–234)
Author Location gp120 (IIIB)
Epitope PAGFAILKCNNKTFN
Epitope name pep24
Immunogen vaccine
Vector/Type: Streptococcus gordonii *HIV component:* gp120
Species (MHC) human
Keywords immunodominance
References Pozzi *et al.* 1994

- This previously described immunodominant Th cell epitope was fused to the streptococcal surface protein M6 (emm-6.1), for expression on the surface of the bacterium Streptococcus gordonii.
- Recombinant bacteria showed efficient MHC class II mediated presentation of gp120 to T-cells by stimulation of a proliferative response in a human T cell clone specific for pep24.

References Malhotra *et al.* 2003

- 92 acute- or early-HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymophoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy.
- This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail.These Th reponses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintained in Env.

Epitope LNESVVINCTRPNNNTRRRL
Epitope name Peptide 27
Immunogen vaccine
Vector/Type: protein *Strain:* B clade 89.6 *HIV component:* gp120 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72)
Species (MHC) mouse
Donor MHC H-2k, H2-d
Keywords epitope processing, immunodominance
References Dai *et al.* 2001

- Helper T-cell proliferative responses to gp120 vaccines in 2 mouse strains, CBA/J and BALB/c, were mapped using 47 overlapping peptides that span gp120. Promiscuously immunodominant peptides were identified in both mice strains that were located in the outer domain of gp120 and were associated with regions of local structural disorder in proximal N-terminal segments, suggesting 3-D protein structure influences Th antigen processing and the frequency of immunogenic sequences.
- This peptide was reactive in only 1/10 BALB/c mice tested, but reacted in 8/10 CBA/J mice.

Assay type CD4 T-cell Elispot - IFNγ
Keywords immunodominance, structure
References Mirano-Bascos *et al.* 2008

- This study presents helper T-cell epitope mapping data on 7 HIV patients, performed with 47 overlapping 20-mer peptides spanning gp120 sequence, strain 89.6.
- Immunodominance patterns measured as either the number of IFN-γ producing cells or the number of responding individuals, were similar to the immunodominance patterns previously described in mice, and correlated to the structure of the protein antigen.
- Epitopes were found adjacent to flexible protein regions and variable sequences. Immunodominant epitopes were found to be located primarily in the outer domain, an average of 12 residues C-terminal to flexible loops. In the less immunogenic inner domain, epitopes were found an average of five residues N-terminal to conserved regions of the protein, once again placing the epitopes C-terminal to flexible loops.
- 2 out 7 individuals responded to this peptide.

Epitope VEINCTRPNNNTRKRIRIQ?
Epitope name F1
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
References Geretti *et al.* 1994

- Th proliferative responses were studied in 36 asymptomatic HIV-1 + patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools.
- After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders.
- IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation.
- Only 1/15 responders recognized this peptide, but it had the highest SI in the study of 9.9.

HXB2 Location gp160 (296–307)
Author Location gp120 (301–324 RF)
Epitope CTRPNNNTRKSI
Immunogen HIV-1 infection
Species (MHC)
Keywords epitope processing
References de Lorimier *et al.* 1994

- Proton NMR spectroscopy was employed to analyze the solution conformation of a hybrid peptide, T1-SP10RF, in order to better understand the immunogenicity of its' T helper (KQIINMWQEVGKAMYA, CTRPNNNTRKSI), CTL (SITKGPGRVIYATG) and B-cell epitopes (RKSITKGPGRVIYATG).
- This epitope embedded in the T1-SP10RF peptide does not form a helical amphipathic conformation. It lacks random-coil conformations, and this may make a peptide less susceptible to complete proteolytic degredation and be favored within epitopes.

Immunogen vaccine
Vector/Type: peptide *Strain:* B clade MN
HIV component: V3
Species (MHC) mouse (H-2^d)
References Oscherwitz *et al.* 1999b

- Epitope presented as a tandem repeat (eight copies) elicits stronger B-cell and T-cell responses than the epitope presented as a single copy.
- This study indicates that the increased response was not due to neodeterminants created at the junction of the peptides, but rather due to an epitope density effect, increased immunogenicity through a high ratio of epitope to protein.

HXB2 Location gp160 (297–330)
Author Location Env (303–335 BX08)
Epitope TRPNNNTRKSIHIGPGRAFYATGEIIGDIRQAH
Immunogen vaccine
Vector/Type: lipopeptide
Species (MHC) human
References Gahery-Segard *et al.* 2000

- Anti-HIV lipopeptide vaccine consisting of six long peptides derived from Nef, Gag and Env HIV-1 proteins modified by a palmitoyl chain was administered in a phase I trial.
- A CD4+ T cell proliferative response to at least one of the six peptides was observed in 9/10 vaccinees – 6/10 reacted to this peptide.
- 9/12 tested mounted a CTL responses to at least one of the six peptides, each of the six peptides elicited a CTL response in at least one individual – this peptide was particularly immunogenic, eliciting a CTL response in five vaccinees.
- None of the 12 tested had an IgG response to gp120 or gp160 and vaccinees could be differentiated from HIV-1 seropositive individuals with a commercial HIV detection kit – no neutralizing antibodies were observed.

HXB2 Location gp160 (298–307)
Author Location Env (UG92005)
Epitope RPYNNTRKGI
Immunogen vaccine
Vector/Type: DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)
Species (MHC) mouse (H-2 IA^b)
Keywords subtype comparisons, epitope processing, TCR usage
References Surman *et al.* 2001

- This epitope is located in the V3 region of UG92005 (UG, clade D) and was recognized by a hybridoma with Vβ usage not determined.
- The epitope described here is the region of overlap of two 15 mers that were both able to stimulate IL-2 production from the hybridoma (TINCTRPYNNTRKGI and RPYNNTRKGIHIGPG)
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.

T-Helper CD4+

- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

Keywords subtype comparisons, responses in children, mother-to-infant transmission
References Kuhn *et al.* 2001a
- In a S. African perinatal transmission study, 33% (33/86) of cord blood samples from infants with seropositive mothers produced T-helper responses (measured by a bioassay measuring IL2 production in a murine cell line and confirmed with a proliferation assay) against a peptide cocktail containing Th epitopes P18 MN, P18 IIIB, T1, T2, and TH4.
- The mothers were predominantly infected with subtype C, but the T help response was detectable in a number of cord blood samples despite using peptides based on B subtype reagents.
- 3/33 infants with cord blood T help responses to Env were infected *in utero*, 2/33 were lost to follow up, and 28/33 were not infected. 6/53 of the infants with cord blood that was unresponsive to Env peptide stimulation were infected before delivery, and 8/47 contracted HIV intrapartum or via breastfeeding.
- Measurable HIV specific T help responses elicited in the immunologically immature newborn, possibly in response to *in utero* exposure, are associated with a protective natural immunity that helps block mother-infant transmission of HIV-1.

References Kuhn *et al.* 2001a
- In a S. African perinatal transmission study, 33% (33/86) of cord blood samples from infants with seropositive mothers produced T-helper responses (measured by a bioassay measuring IL2 production in a murine cell line and confirmed with a proliferation assay) against a peptide cocktail containing Th epitopes P18 MN, P18 IIIB, T1, T2, and TH4.
- The mothers were predominantly infected with subtype C, but the T help response was detectable in a number of cord blood samples despite using peptides based on B subtype reagents.
- 3/33 infants with cord blood T help responses to Env were infected *in utero*, 2/33 were lost to follow up, and 28/33 were not infected. 6/53 of the infants with cord blood that was unresponsive to Env peptide stimulation were infected before delivery, and 8/47 contracted HIV intrapartum or via breastfeeding.
- Measurable HIV specific T help responses elicited in the immunologically immature newborn, possibly in response to *in utero* exposure, are associated with a protective natural immunity that helps block mother-infant transmission of HIV-1.

- The proliferative responses in cord blood at delivery to a cocktail of HIV Envelope peptides were infrequent (1/41) among infants whose HIV-positive mothers received antiretroviral prophylaxis at delivery to prevent transmission. Responses were 10 times more frequent among infants of HIV-seropositive women who had no antiretroviral treatment (7/29). Reductions of HIV-specific responses occurred despite persistance of detectable HIV RNA in the mothers at delivery.

- The reduction of Th responses in newborns raises the possibility that anti-retrovial exposure during pregnancy may block subsequent immune protection. The authors point two relevant citations that showed ARV exposed infants had a more rapid course of progression (Kuhn *et al.*, JID 182:104 (2000)), but were at no greater risk of infection due to subsequent breast feeding (Ditrame *et al.*, Lancet 354:2050 (1999)).

Species (MHC) mouse
References Barouch *et al.* 2002

- gp120 encoding DNA co-injected with a plasmid carrying GMCSF gave meager CD4+ T-cell responses in BALB/c mice relative to bicistronic gp120 and GMCSF cloned into the same vector and expressed from the same promoter.
- The bicistronic gp120/GM-CSF vaccine induced an approximately 10-fold increase of CD4+ T cell proliferative responses to gp120, as well as a significant increase in IL-2, IL-4, IL-10, IFN-γ and GM-CSF production, compared to immunization with the monocistronic pVIJ-gp120 with GMCSF. The enhanced proliferative responses were substantiated by CD4+ T-cell Elispot.
- Both mono and bicistronic DNA vaccines induced similar CTL responses directed against the H-2Dd restricted P18 peptide RGPRAFTVTI in murine splenocytes despite the enhanced proliferative responses.

Species (MHC) mouse (H-2 IA^b)
Keywords subtype comparisons, epitope processing, TCR usage
References Surman *et al.* 2001

- This epitope is located in the V3 region of UG92005 (UG, clade D) and was recognized by two hybridomas with Vβ usage not determined, but one used Vα 8.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

Epitope `IIGDIRQAHCNISRE`
Immunogen vaccine
Vector/Type: DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)
Species (MHC) mouse (H-2 IA^b)
Keywords subtype comparisons, epitope processing, TCR usage
References Surman *et al.* 2001

- This epitope is located in the V3 region of 1007 (US, clade B) and was recognized by three hybridomas with Vβ usage Vβ 6 and not determined.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

References Sealy *et al.* 2008

- Murine hybridomas with known Env peptide specificities were tested for IL-2 production following stimulation with autologous splenocytes exposed to HIV-1-infected CXCR4 GHOST cells. Hybridomas were originally derived from C57BL/6 mice immunized with a prime-boost regimen. Antigen-processing potentials in the mouse system were studied.
- The presence of a target sequence within HIV-1 did not ensure T-cell reactivity. Subtype of immunogen used to elicit T-cell reactivity also did not predict T-cell responsiveness.
- IIGDIRQAHCNISRE was the target sequence for hybridoma 1007P3-11 and differed in 4 residues from HIV-1 pNL43 sequence infecting GHOST cells. The hybridoma was not responsive.

Immunogen HIV-1 infection
Species (MHC) human
References Geretti *et al.* 1994

- Th proliferative responses were studied in 36 asymptomatic HIV-1 + patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools.
- After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders.
- IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation.
- 1/15 responders recognized this peptide, SI = 7.6.

References Zhan *et al.* 2004

- To develop a polyvalent Env vaccine, subtype specific B and D T-helper epitopes were identified, and mixtures of strain 1007, clade B, or UG92005, clade D envelopes were given to C57BL/6J mice. Mice were intramuscularly immunized with recombinant DNA, then intraperitoneally with rVV and finally with env protein in CFA. A dilution of 1/100 could still elicit type specific responses, and responses persisted with different prime boost combinations.

T-Helper CD4+

- Priming with 1007 and UG92005 env's induced both Env-specific (SNNTVGNPIILPCRI and AMYAPPIAGLIQCSS) and cross-reactive (PKVSFEPIPIHYCAP, C2, GNIRQAHC-NVSKAKW, V3-C3) Th responses in murine spleen cells.

Assay type CD4 T-cell Elispot - IFNγ
Keywords immunodominance, structure
References Mirano-Bascos *et al.* 2008

- This study presents helper T-cell epitope mapping data on 7 HIV patients, performed with 47 overlapping 20-mer peptides spanning gp120 sequence, strain 89.6.
- Immunodominance patterns measured as either the number of IFN-γ producing cells or the number of responding individuals, were similar to the immunodominance patterns previously described in mice, and correlated to the structure of the protein antigen.
- Epitopes were found adjacent to flexible protein regions and variable sequences. Immunodominant epitopes were found to be located primarily in the outer domain, an average of 12 residues C-terminal to flexible loops. In the less immunogenic inner domain, epitopes were found an average of five residues N-terminal to conserved regions of the protein, once again placing the epitopes C-terminal to flexible loops.
- 2 out 7 individuals responded to this peptide.

References Dai *et al.* 2001

- Helper T-cell proliferative responses to gp120 vaccines in 2 mouse strains, CBA/J and BALB/c, were mapped using 47 overlapping peptides that span gp120. Promiscuously immunodominant peptides were identified in both mice strains that were located in the outer domain of gp120 and were associated with regions of local structural disorder in proximal N-terminal segments, suggesting 3-D protein structure influences Th antigen processing and the frequency of immunogenic sequences.

- This peptide was reactive in 8/10 BALB/c mice tested, and in 6/10 CBA/J mice, and was considered one of the 3 immunodominant peptides identified that were shared in both mouse strains: RRNIIGDIRQAHCNISRAKW, NNTLQQIVIKLREKFRNKTI, GTNGTEGNDIITLQCRIKQI.

Epitope SNNTVGNPIILPCRI
Immunogen vaccine
Vector/Type: DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)
Species (MHC) mouse (H-2 IA^b)
Keywords subtype comparisons, epitope processing, TCR usage
References Surman *et al.* 2001

- This epitope is located in the V4C4 region of 1007 (US, clade B) and was recognized by 13 hybridomas with Vβ usage Vβ 4, 7, 8.1, 8.2, 10, 12 and not determined – one of the Vβ 8.2 was shown to utilize Vα 2.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

References Zhan *et al.* 2004

- To develop a polyvalent Env vaccine, subtype specific B and D T-helper epitopes were identified, and mixtures of strain 1007, clade B, or UG92005, clade D envelopes were given to C57BL/6J mice. Mice were intramuscularly immunized with recombinant DNA, then intraperitoneally with rVV and finally with env protein in CFA. A dilution of 1/100 could still elicit type specific responses, and responses persisted with different prime boost combinations.
- T-cell hybridoma 1007P3-23 was isolated from mice immunized with 1007, and it recognized the peptide SNNTVGNPIILPCRI of the V4/C4 region. The minimal, core peptide recognized by 10007P3-23 was NPIIL, a sequence not found in UG92005, which has a deletion in the core, so that the equivalent region in the D isolate is NNET—ITLQCRI
- Priming mixtures of 1007 and UG92005 induced both Env-specific (SNNTVGNPIILPCRI and AMYAPPIAGLIQCSS) and cross-reactive (PKVSFEPIPIHYCAP, C2, GNIRQAHCNVSKAKW, V3-C3) Th responses in murine spleen cells.

Assay type proliferation
Keywords optimal epitope
References Okazaki *et al.* 2006

- KQIINMWQEVGKAMYA-specific human CD4+ T-cell line from a healthy Caucasian American volunteer immunized with a canarypox virus vector expressing gp120 and boosted with recombinant gp120 was developed and found to be restricted to DRβ1*13. Epitope enhancement with different amino acid substitutions was studied.
- Likely binding core for KQIINMWQEVGKAMYA was determined as WQEVGKAMY, based on single A or S substitutions that diminished recognition, and proliferation assay data using truncated peptides.
- HLA binding motif was studied using substituted peptides in anchor positions 1,4,6,9 from the N-terminus of WQEVGKAMY. In position 1, CD4+ response was reduced by kqiinm[w/ai]QEVGKAMYa substitutions, but not by kqiinm[w/f]QEVGKAMYa substitution suggesting a requirement of aromatic amino acid. In position 4, CD4 response was reduced by kqiinmMWQE[v/af]GKAMYa substitutions, but enhanced by kqiinmWQE[v/i]GKAMYa substitution, suggesting a requirement of aliphatic amino avid. In position 6, response was reduced by kqiinmWQEVG[k/ae]AMYa substitutions, but was enhanced by positively charged R substitution (kqiinmWQEVG[k/r]AMYa). In position 9, all peptides substituted with small, aromatic, or aliphatic amino acids (kqiinmWQEVGKAM[y/afi]a) induced enhanced response.
- The altered KQIINMWQE[v/i]GKAMYA peptide produced higher IFN-γ production that the original peptide, suggesting greater CD4 T-cell activation in a Th1 functional response.
- Triple substituted peptide KQIINMWQE[v/i]G[k/r]AM[y/a]A shifted the peak proliferative response to lower concentrations.

- Two immunogens were combined in the CombiHIV vac (VLP-TBI-pcDNATCI) vaccine: artificial polyepitope protein TBI, containing T- and B-cell epitopes from Env and Gag and the DNA vaccine construct pcDNA-TCI, carrying CTL and CD4+ epitopes from Env, Gag, Pol, Nef.
- Combination of two B- and T-cell immunogens resulted in increase in the antibody response (but not CTL response) to both TBI protein and the proteins from HIV-1 lysate, compared to the level of antibodies induced by immunization with either immunogen alone. The synergistic effect in the induction of B-cell-mediated response was explained by the presence of CD4+ T-helper epitopes in TCI, due to stimulation of B-cell proliferation and differentiation.
- Peptide N16, KQIINMWQEVGKAMYA, was used as a specific antigen for ELISpot positive control. N16 was previously known to induce T-helper responses not only in mice but also in humans and monkeys. It is a previously known epitope that is a part of TCI fragment RIKQIINMWQEVGKAMYAPPISGQIR in this vaccine construct.

Epitope KQIINMWQEVGKAMYA
Epitope name T1
Immunogen vaccine
Vector/Type: peptide *Strain:* B clade IIIB
Species (MHC) mouse (H-2Eα $E\beta^k$)
References Boehncke *et al.* 1993
- C3H $H2^k$ mice were used for immunization in the study because H-2^k mice are particularly good T1 responders – T1 can be presented by Eα $E\beta^k$ but not Eα $E\beta^b$ – the nature of the T1 class II molecular interaction was thoroughly explored.
- Alanine substitutions across peptide did not negatively affect MHC binding or effective presentation of epitope, except at three critical residues (432N, 435Q, 439K), however substitutions with larger side chains often diminished activity – only a few amino acids were found to be critical for class II interaction and for maintaining T-cell receptor specificity.
- A gain in potency was observed when 436E was replaced with A, suggesting that substitutions in positions that interfere with binding might allow the design of a more potent vaccine.

Vector/Type: peptide *Strain:* modified B clade IIIB *HIV component:* Env
Species (MHC) mouse (H-2E^k)
Assay type Cytokine production, Th support of CTL response
Keywords binding affinity, Th1
References Ahlers *et al.* 2001

- BALB/c and A.AL were immunized with an Env-peptide vaccine construct containing the CTL epitope P18IIIB and a T helper epitope.
- Substitution of Glu (wt) to Ala, kqiinmwqAvgkamya, caused increased affinity for MHC class II Ek. This resulted in the upregulation of CD40L in the responding Th cells, and shifted the response towards Th1. Increased Th responses stimulated DCs to produce higher levels of IL-12, and B7-1 and B7-2, thus enhance CTL responses.
- The modified epitope, T1A, elicited stronger protection against increasing doses of viral challenge with vaccinia expressing HIV-1 IIIB gp120 compared to the wildtype epitope T1.

Keywords subtype comparisons, responses in children, mother-to-infant transmission
References Kuhn *et al.* 2001a

- In a S. African perinatal transmission study, 33% (33/86) of cord blood samples from infants with seropositive mothers produced T-helper responses (measured by a bioassay measuring IL2 production in a murine cell line and confirmed with a proliferation assay) against a peptide cocktail containing Th epitopes P18 MN, P18 IIIB, T1, T2, and TH4.
- The mothers were predominantly infected with subtype C, but the T help response was detectable in a number of cord blood samples despite using peptides based on B subtype reagents.
- 3/33 infants with cord blood T help responses to Env were infected *in utero*, 2/33 were lost to follow up, and 28/33 were not infected. 6/53 of the infants with cord blood that was unresponsive to Env peptide stimulation were infected before delivery, and 8/47 contracted HIV intrapartum or via breastfeeding.
- Measurable HIV specific T help responses elicited in the immunologically immature newborn, possibly in response to *in utero* exposure, are associated with a protective natural immunity that helps block mother-infant transmission of HIV-1.

Keywords epitope processing
References de Lorimier *et al.* 1994

- Proton NMR spectroscopy was employed to analyze the solution conformation of a hybrid peptide, T1-SP10RF, in order to better understand the immunogenicity of its' T helper (KQIINMWQEVGKAMYA, CTRPNNNTRKSI), CTL (SITKGPGRVIYATG) and B-cell epitopes (RKSITKGPGRVIYATG).
- As a free peptide, the T1 segment, a T-helper epitope is in an extended conformation with nascent helical conformation. It may form a beta strand in native gp120, and a nonnative conformation may account for the inability of free T1 peptide to elicit antibody responses, in contrast to the T1 segment in native gp120. It lacks random-coil conformations, and it is suggested that this may make the peptide less susceptible to complete proteolytic degredation, and be favored within epitopes.

References Bazhan *et al.* 2008

- Two immunogens were combined in the CombiHIV vac (VLP-TBI-pcDNATCI) vaccine: artificial polyepitope protein TBI, containing T- and B-cell epitopes from Env and Gag and the DNA vaccine construct pcDNA-TCI, carrying CTL and CD4+ epitopes from Env, Gag, Pol, Nef.
- Combination of two B- and T-cell immunogens resulted in increase in the antibody response (but not CTL response) to both TBI protein and the proteins from HIV-1 lysate, compared to the level of antibodies induced by immunization with either immunogen alone. The synergistic effect in the induction of B-cell-mediated response was explained by the presence of CD4+ T-helper epitopes in TCI, due to stimulation of B-cell proliferation and differentiation.
- VGKAMYAPPISGQIR is a previously known epitope that is a part of TCI fragment RIKQIINMWQEVGKAMYAPPISGQIR in this vaccine construct.

Epitope VGKAMYAPPISGQIRCSSNITGLL
Immunogen vaccine
Vector/Type: protein *HIV component:* gp160
Species (MHC) mouse (H-2^b)
Keywords epitope processing
References Sjolander *et al.* 1996

- Study demonstrates that T-cell determinants from glycoproteins can depend on the glycosylation of the protein.
- Peptide stimulation of an *in vitro* proliferative response required *in vivo* priming with glycosylated protein.
- Local glycosylation sites thought not to be part of the epitope, but may be important for epitope processing.

HXB2 Location gp160 (432–451)
Author Location gp120 (432–451 IIIB)
Epitope KAMYAPPISGQIRCSSNITG?
Epitope name H4
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
References Geretti *et al.* 1994

- Th proliferative responses were studied in 36 asymptomatic HIV-1 + patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools.
- After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders.
- IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation.
- 1/15 responders recognized this peptide, SI = 6.3.

HXB2 Location gp160 (433–447)
Author Location Env (UG92005)
Epitope AMYAPPIAGLIQCSS
Immunogen vaccine
Vector/Type: DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)
Species (MHC) mouse (H-2 IA^b)
Keywords subtype comparisons, epitope processing, TCR usage
References Surman *et al.* 2001

- This epitope is located in the C4 region of UG92005 (UG, clade D) and was recognized by ten hybridomas with Vβ usage Vβ 6, 8.1, 8.2, 13, 14 and not determined – among the ND Vβ set, three Vαs were identified, Vα 2, 8, and 11.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

HXB2 Location gp160 (433–447)
Author Location Env (gp160) (UG92005)
Epitope AMYAPPIAGLIQCSS
Subtype D
Immunogen vaccine

Assay type Cytokine production, CD4 T-cell Elispot - IFNγ
Keywords vaccine-induced epitopes, variant cross-recognition or cross-neutralization, vaccine antigen design
References Zhan *et al.* 2004

- To develop a polyvalent Env vaccine, subtype specific B and D T-helper epitopes were identified, and mixtures of strain 1007, clade B, or UG92005, clade D envelopes were given to C57BL/6J mice. Mice were intramuscularly immunized with recombinant DNA, then intraperitoneally with rVV and finally with env protein in CFA. A dilution of 1/100 could still elicit type specific responses, and responses persisted with different prime boost combinations.
- T-cell hybridoma UGP2-17 was isolated from mice immunized with env sequence UG92005 (clade D), and it recognized the C4/V4 region peptide AMYAPPIAGLIQCSS. The minimal peptide recognized by 10007P3-23 was PPIAGLIQ, which matched only 5/8 residues in the B clade isolate, ppiRgQiK.

T-Helper CD4+

- Priming with 1007 and UG env's induced both Env-specific (SNNTVGNPIILPCRI and AMYAPPIAGLIQCSS) and cross-reactive (PKVSFEPIPIHYCAP, C2, GNIRQAHC-NVSKAKW, V3-C3) Th responses in murine spleen cells.

Epitope YKVVEIKPLGVAPTT
Subtype C
Immunogen vaccine
Vector/Type: vaccinia, modified vaccinia Ankara (MVA), poxvirus, DNA prime with poxvirus boost, attenuated poxvirus vector NYVAC *Strain:* C clade 97CN54 *HIV component:* Env, Gag, Nef, Pol
Species (MHC) human
Country Switzerland
Assay type proliferation, CD8 T-cell Elispot - IFNγ, Other
Keywords vaccine-induced epitopes, vaccine antigen design
References Harari *et al.* 2008

- A poxvirus based vaccine against HIV-1 subtype C was characterized and found to be efficacious. DNA prime, NYVAC boost vaccine containing Env, Gag, Pol, and Nef as a polypeptide immunogen elicited T-cell responses in 90% vaccinees.

- Vaccine induced T-cell response was of a high magnitude and polyfunctional with respect to CD4 and CD8 cell activation. Each responding vaccinee elicited broad responses to multiple epitopes, especially in Env, that persisted.
- A CD4 helper Env epitope, previously not described was found within peptides ELYKYKVVEIKPLGV and YKVVEIKPLGVAPTT and elicited immune response.
- 9 novel Env epitopes, both CTL and helper, were found to be targeted after vaccination in subjects.

Epitope EPLGVAPTKAKRRVVQREKRA?
Epitope name I5
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
References Geretti *et al.* 1994

- Th proliferative responses were studied in 36 asymptomatic HIV-1 + patients. PBMC from 15/36 patients responded to stimulation with gp120 synthetic overlapping peptide pools. 10 of the responding patients recognized three or more peptide pools.
- After 12 months, most responses were lost or diminished, and specific responses fluctuated. 4/10 of the responders at baseline had new responses at 12 months, as did 5/15 non-responders.
- IL-2 production was a more sensitive and well-preserved measure of Th function than proliferation.
- 1/15 responders recognized this peptide, SI = 4.9.

Vector/Type: protein *Strain:* B clade 89.6 *HIV component:* gp120 *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72)
Species (MHC) mouse
Donor MHC H-2k, H2-d
Keywords epitope processing, immunodominance
References Dai *et al.* 2001

- Helper T-cell proliferative responses to gp120 vaccines in 2 mouse strains, CBA/J and BALB/c, were mapped using 47 overlapping peptides that span gp120. Promiscuously immunodominant peptides were identified in both mice strains that were located in the outer domain of gp120 and were associated with regions of local structural disorder in proximal N-terminal segments, suggesting 3-D protein structure influences Th antigen processing and the frequency of immunogenic sequences.
- This peptide was reactive in only 2/10 BALB/c mice tested, and in 8/10 CBA/J mice.

Epitope PIGVAPTRAKRRTVQREKR
Immunogen HIV-1 infection
Species (MHC) human
Country United States
Assay type CD4 T-cell Elispot - IFNγ
Keywords immunodominance, structure
References Mirano-Bascos *et al.* 2008

- This study presents helper T-cell epitope mapping data on 7 HIV patients, performed with 47 overlapping 20-mer peptides spanning gp120 sequence, strain 89.6.
- Immunodominance patterns measured as either the number of IFN-γ producing cells or the number of responding individuals, were similar to the immunodominance patterns previously described in mice, and correlated to the structure of the protein antigen.
- Epitopes were found adjacent to flexible protein regions and variable sequences. Immunodominant epitopes were found to be located primarily in the outer domain, an average of 12 residues C-terminal to flexible loops. In the less immunogenic inner domain, epitopes were found an average of five residues N-terminal to conserved regions of the protein, once again placing the epitopes C-terminal to flexible loops.
- 6 out 7 individuals responded to this peptide.

Immunogen HIV-1 infection
Species (MHC) human
Assay type Cytokine production, proliferation, CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords HAART, ART, acute/early infection
References Malhotra *et al.* 2003

T-Helper CD4+

- 92 acute- or early-HIV infected subjects were tested for Env- and Gag-specific Th responses. There was an overall low probability of detecting HIV-1-specific Th responses, Env responses were rare and (5%) and only detected very early in infection, probably reflecting a low frequency of response and impaired lymophoproliferative capacity, not viral escape. Gag-specific Th responses were observed more frequently (16%), were found throughout the acute and early infection phases, and predominated after ARV therapy.
- This epitope is one of six Env-specific Th responses detected in one patient 11 days post-infection that were studied in detail. These Th reponses were not detected at subsequent time points, despite the Env specific Th cells being maintained as detected by TCR clonal transcripts, and the epitope sequence being maintained in Env.

Epitope TNVPWNASWSNKSLE
Immunogen vaccine
Vector/Type: DNA, protein, vaccinia *Strain:* B clade 1007, D clade UG92005 *HIV component:* gp140 *Adjuvant:* Complete Freund's Adjuvant (CFA)
Species (MHC) mouse (H-2 IA^b)
Keywords subtype comparisons, epitope processing, TCR usage
References Surman *et al.* 2001
- This gp140 epitope of UG92005 (UG, clade D) was recognized by five hybridomas with Vβ usage Vβ 8.1, 14 and not determined – one of the Vβ 8.1 was shown to utilize Vα 8.
- C57BL/6 mice were immunized with a prime-boost strategy involving three HIV-1 Env antigens: Mice were primed with DNA given i.m., 3-4 weeks later boosted with VV, and 3-4 weeks later boosted again with purified protein in Freund's adjuvant.
- The vaccinia construct is a pSC11-based VV vector with the first 38 amino acids contributed by BH10 and the rest of gp120 and gp41 by the vaccine strain, the DNA construct is in the pJW4303 vector with a CMV promotor, and the purified protein is expressed from the pJW4303 vector transfected into CHO-K1 cells.
- Ten days after the final boost, hybridomas were made and tested for IL-2 production using either B6 spleen cells or H-2 IA^b transfected L cells as targets and Vβ usage was determined.
- Mice were immunized with an Env from either one of two clades: HIV-1 1007, a clade B strain isolated from an individual from Memphis Tennesee, and HIV-1 92UG005, a clade D vaccine isolated from Uganda in 1992 through the WHO.
- 80 unique clonotypes were characterized from six mice.
- H-2 IA^b restricted T-helper epitopes were concentrated in 5 distinct regions within the Env sequence (2 clonotype responses in V2, 26 in C2, 22 in V3, 23 in V4C4, and 7 in gp41).
- Epitope hotspots tended to be proximal to heavily glycosylated regions of the Env sequence, in exposed, non-helical strands of the protein. The non-uniform localization may be

T-Helper CD4+

influenced by differential antigen processing and the glycosylation site proximity may allow binding to lectins and promote trafficking through processing pathways.

T-Helper CD4+

Assay type CD4 T-cell Elispot - IFNγ
Keywords subtype comparisons, computational epitope prediction, vaccine antigen design
References De Groot *et al.* 2005

- 9-mers conserved across clades were analyzed by computer for affinity to DRB*0101. 23-mers were synthesized based on these predicted epitopes. 19/20 of these 23-mers were confirmed to be immunogenic in US HIV-infected subjects.
- 4/13 US test subjects responded to this 23-mer by CD4 EliSpot assay. The core computer-predicted peptide was YHRLRDLLL.

HXB2 Location gp160 (772–787)
Author Location gp41 (261–276 clade B consensus)
Epitope `RDLLLIVTRIVELLGR`
Subtype B
Immunogen HIV-1 infection, computer prediction
Species (MHC) human (DRB1*0101, DRB1*0701, DRB1*1101)
Country Brazil
Assay type CD4 T-cell Elispot - IFNγ, HLA binding
Keywords binding affinity, computational epitope prediction, cross-presentation by different HLA
References Fonseca *et al.* 2006

- TEPITOPE algorithm was used to screen the most conserved regions of clade B consensus sequence for multiple HLA-DR binding epitopes. Peptides predicted to bind 16 or more HLA-DR molecules were synthesized and further assessed in binding assays and for T-cell recognition in a cohort of 32 brazilian HIV-1 chronically infected individuals.
- While RDLLLIVTRIVELLGR was the reacting peptide, shorter LLLIVTRIVELL peptide was predicted by TEPITOPE to bind HLA-DR molecules. Flanking amino acids were added to increase the efficiency of in vitro peptide presentation to CD4 T cells.

HXB2 Location gp160 (780–794)
Author Location gp41 (787–801 IIIB)

Epitope DRVIEVVQGAYRAIR
Epitope name N15
Immunogen vaccine
Vector/Type: DNA, virus-like particle (VLP), HIV infected-cell lysate, polyepitope *HIV component:* Env, Gag, Nef, Pol
Species (MHC) mouse (H-2^b, H-2^k)
Country Russia
Assay type T-cell Elispot
Keywords vaccine antigen design
References Bazhan *et al.* 2008

- Two immunogens were combined in the CombiHIV vac (VLP-TBI-pcDNATCI) vaccine: artificial polyepitope protein TBI, containing T- and B-cell epitopes from Env and Gag and the DNA vaccine construct pcDNA-TCI, carrying CTL and CD4+ epitopes from Env, Gag, Pol, Nef.
- Combination of two B- and T-cell immunogens resulted in increase in the antibody response (but not CTL response) to both TBI protein and the proteins from HIV-1 lysate, compared to the level of antibodies induced by immunization with either immunogen alone. The synergistic effect in the induction of B-cell-mediated response was explained by the presence of CD4+ T-helper epitopes in TCI, due to stimulation of B-cell proliferation and differentiation.
- Peptide N15, DRVIEVVQGAYRAIR, was used as a specific antigen for ELISpot positive control. N15 was previously known to induce T-helper responses not only in mice but also in humans and monkeys. It is a previously known epitope that is a part of TCI fragment SLLNATDIAVAEGTDRVIEVVQ-GAYRAIRHIPRRIRQGLERILL in this vaccine construct.

Species (MHC) human
Keywords subtype comparisons, responses in children, mother-to-infant transmission
References Kuhn *et al.* 2001a

- In a S. African perinatal transmission study, 33% (33/86) of cord blood samples from infants with seropositive mothers produced T-helper responses (measured by a bioassay measuring IL2 production in a murine cell line and confirmed with a proliferation assay) against a peptide cocktail containing Th epitopes P18 MN, P18 IIIB, T1, T2, and TH4.
- The mothers were predominantly infected with subtype C, but the T help response was detectable in a number of cord blood samples despite using peptides based on B subtype reagents.
- 3/33 infants with cord blood T help responses to Env were infected *in utero*, 2/33 were lost to follow up, and 28/33 were not infected. 6/53 of the infants with cord blood that was unresponsive to Env peptide stimulation were infected before delivery, and 8/47 contracted HIV intrapartum or via breast-feeding.
- Measurable HIV specific T help responses elicited in the immunologically immature newborn, possibly in response to *in utero* exposure, are associated with a protective natural immunity that helps block mother-infant transmission of HIV-1.

HXB2 Location gp160 (827–841)

Epitope DRVIEVVQGAYRAIR
Epitope name TH4-1
Immunogen HIV-1 infection
Species (MHC) human
Assay type proliferation
Keywords responses in children, mother-to-infant transmission
References Kuhn *et al.* 2001b

- Th proliferative responses in cord blood at delivery to a cocktail of HIV envelope peptides were infrequent (1/41) among infants whose HIV-positive mothers received antiretroviral prophylaxis at delivery to prevent transmission. Responses were 10 times more frequent among infants of HIV-seropositive women who had no antiretroviral treatment (7/29). Reductions of HIV-specific responses occurred despite persistance of detectable HIV RNA in the mothers at delivery.
- The reduction of Th responses in newborns raises the possibility that anti-retrovial exposure during pregnancy may block subsequent immune protection. The authors point two relevant citations that showed ARV exposed infants had a more rapid course of progression (Kuhn *et al.*, JID 182:104 (2000)), but were at no greater risk of infection due to subsequent breast feeding (Ditrame *et al.*, Lancet 354:2050 (1999)).

T-Helper CD4+

- Two immunogens were combined in the CombiHIV vac (VLP-TBI-pcDNATCI) vaccine: artificial polyepitope protein TBI, containing T- and B-cell epitopes from Env and Gag and the DNA vaccine construct pcDNA-TCI, carrying CTL and CD4+ epitopes from Env, Gag, Pol, Nef.
- Combination of two B- and T-cell immunogens resulted in increase in the antibody response (but not CTL response) to both TBI protein and the proteins from HIV-1 lysate, compared to the level of antibodies induced by immunization with either immunogen alone. The synergistic effect in the induction of B-cell-mediated response was explained by the presence of CD4+ T-helper epitopes in TCI, due to stimulation of B-cell proliferation and differentiation.
- QGAYRAIRHIPRRIR is a previously known epitope that is a part of TCI fragment SLLNATDIAVAEGTDRVIEVVQ-GAYRAIRHIPRRIRQGLERILL in this vaccine construct.

HXB2 Location gp160 (834–848)

Keywords HAART, ART
References Clerici *et al.* 2002b

- Specific immunity was compared in a two-year study of chronically HIV-1 infected i) HAART-naive patients who were not progressing and had strong immune responses, ii) newly treated patients followed for 24 months after initiation of HAART, iii) and long-term HAART patients who had been on HAART at least 12 months prior to the study.
- HAART naïve patients had strongest proliferative responses at time zero, but long-term HAART patients the most significant increase in specific responses over the two year study period against HIV-1 gp160, influenza, and Candida. Similarly, IL-2 and IFN-γ production in responses to gp160 was highest in the naïve group at time zero, but increased the most in the long-term HAART treated patients.
- Short-term HAART patients showed a significant improvement in their CD4+ T cell count and a reduction of plasma viremia, and had augmented IL-7 production, which was slightly reduced in long-term HAART patients.

Immunogen HIV-1 infection
Species (MHC) human
Keywords HAART, ART
References Palmer *et al.* 2002

- CD4+ T cell proliferative responses from 33 HIV-1 infected patients with HAART suppression were compared to 19 patients with active viral replication (HAART failures and HAART naive). Patients with HAART suppression showed stronger p24- and p66-specific proliferative responses compared to patient groups with active HIV-1 replication, suggesting active viral replication *in vivo* specifically reduces proliferation responses.
- gp160 proliferation responses were apparent in 7/32 donors tested, but weaker overall, with a median value for the suppressed group not above that found for HIV seronegative controls.
- No differences in the frequency of HIV-specific CD4+ T-cells that were positive for cytokine secretion in a flow cytometry assay were found in the HAART suppressed group versus the group with active viral replication.

References Imami *et al.* 2002b

- 70 patients with chronic disease progression, 10 clinical non-progressors, and 3 immunologically discordant progressors (individuals who controlled viremia but had progressive CD4+ T-cell decline) were analyzed for their T-helper cell responses to p24 and cytokine profile.
- In a comparison of responses to HIV-1 proteins based on 10 non-progressors, 3 immunologically discordant, and 70 progressors, SIs were always much higher for non-progressors and immunologically discordant than progressors. Among the non-progressors, the responses to different antigens were greater using p24 peptides than native p24. Native p24, Nef, gp120 proteins, and Remune (gp120 depleted HIV-1, p24 is subtype G), had roughly comparable distributions of SI values from the non-progressors, Nef and gp120 responses were somewhat diminished in immunologically discordant patients.

Vector/Type: canarypox prime with gp160 boost *Strain:* B clade MN/LAI-2 *HIV component:* gp160
Species (MHC) human
Assay type proliferation
Keywords vaccine-specific epitope characteristics, vaccine-induced epitopes
References Ratto-Kim *et al.* 2003

- The CD4+ T-helper response to vaccinees given ALVAC-HIV(vCP205) alone, rgp160 MN/LAI-2 alone, or the two combined in a prime-boost was investigated by establishing T cell lines and comparing proliferative responses to a series of peptides (15 mers overlapping by 10) spanning autologous gp160 MN/LAI-2. Th responses against Env during natural HIV-1 infection were also studied.
- Broad, strong T-helper responses scattered across the Env were obtained from volunteers who received a prime boost vCP205 + rgp160MN/LAI-2, while those receiving rgp160 responded to fewer peptides, and vCP205 to very few peptides.
- HIV-1 + volunteers had less breadth and amplitude of Th responses than vaccinees that got the prime-boost vaccine, although T-cell lines were readily generated from HIV+ individuals. Some vaccinees targeted C1 and C5, while infected individuals did not, and some infected individuals targeted V3, while vaccinees did not.
- The authors note that the differences in response may be contributed to by the fact the peptides used to screen the responses were the same as the vaccine strain, and different than the strains in the natural infection, but that there also may be real immunological differences in the two scenarios of vaccine verses natural infection.

References Smith *et al.* 2005

- Macaques were immunized with a clade B HIV vaccine and tested for responses to pools of clade B and A/G Env and Gag peptides. While CD4 responses were more frequent than CD8 responses, higher cross-clade responses were found for CD8 responses. The authors suggest that the better cross-clade reactivity of the CD8 responses reflects the size difference between CD8 and CD4 epitopes; the smaller CD8 epitopes provide a smaller target for mutation.
- All 5 pools of B Env and Gag peptides stimulated CD4 responses, while only 2 pools of A/G peptides stimulated responses, suggesting that 1 or 2 out of 5 CD4 epitopes were cross-reactive.

Keywords vaccine-induced epitopes, vaccine antigen design
References Sadagopal *et al.* 2005

- 22/23 macaques that were immunized with a DNA prime SHIV-89.6 and boosted with rMVA showed successful control of viremia, with low or undetectable viral loads and normal CD4 counts 200 weeks postchallenge. IFN-gamma producing T cells were found in unexpectedly low breadths and frequencies. T-cell responses were stable over time and maintained their production of IFN-gamma and IL-2. Long-term control was found in macaques of diverse histocompability types. The CD8 T cells seemed to have the most impact on well-contained chronic infections in the vaccinated and challenged animals.
- After challenge, vaccinated animals maintained normal levels of CD4 cells, while unvaccinated animals quickly lost CD4 cells. Both CD4 and CD8 responses were found to the SIV Gag and HIV Env proteins; 60% of CD8+ epitopes and 80% of CD4+ epitopes were in p27.

Assay type proliferation, Flow cytometric T-cell cytokine assay
Keywords memory cells
References Younes *et al.* 2003

- HIV-1-specific CD4+ T-cell responses were analyzed for 6 years since primary infection, in 10 aviremic and 8 viremic patients.
- CD4+ T cells proliferating responses were correlated with the frequency of CD4+ T cells secreting IL-2 in aviremic patients. In viremic patients, CD4+ T cell proliferative response was impaired despite of the high frequencies of IFN-γ, but not IL-2-producing CD4+ T cells in periods of elevated viremia, suggesting that long-term CD4+ memory depends on IL-2-producing CD4+ T cells and that IFN-γ only-producing cells are short lived.

HXB2 Location Nef (45–69)
Author Location Nef (45–69 BRU)
Epitope SSNTAATNAACAWLEAQEEEEVGFP
Immunogen vaccine
Vector/Type: peptide prime with protein boost *Strain:* B clade BRU *HIV component:* Nef
Species (MHC) chimpanzee, rat
References Estaquier *et al.* 1992

- Antigenic domain: ATNAACAWL, priming with peptide enhanced subsequent Ab response to Nef protein immunization.

HXB2 Location Nef (45–69)
Author Location Nef (45–69)
Epitope SSNTAATNAACAWLEAQEEEEVGFP
Immunogen vaccine
Vector/Type: peptide *Adjuvant:* aluminum hydroxide
Species (MHC) rat
Keywords vaccine-specific epitope characteristics
References Rouaix *et al.* 1994

- Covalently linking the potent Th epitope Nef 45-69, which can induce Th proliferative responses at low doses with no adjuvant in Lou/M rats, to a weaker epitope from Schistosoma mansoni allows the induction of detectable Th responses to the Schistosoma epitope.

HXB2 Location Nef (46–65)
Author Location Nef (46–65 LAI)
Epitope SNTAATNAACAWLEAQEEEE
Subtype B
Immunogen vaccine
Vector/Type: DNA *Strain:* B clade LAI *HIV component:* Nef, Rev, Tat
Species (MHC) mouse (H-2^d)
References Hinkula *et al.* 1997

- Stronger, broader responses were observed in animals vaccinated with DNA epidermally rather than with intramuscular protein.
- Some proliferative response to vaccination was observed to peptides throughout Nef and Tat, less for Rev.

HXB2 Location Nef (56–68)
Author Location Nef (56–68)
Epitope AWLEAQEEEEVGF
Epitope name Nef-4
Immunogen HIV-1 infection
Species (MHC) human (DQ)
Country France
Assay type proliferation
Keywords computational epitope prediction, cross-presentation by different HLA
References Pancré *et al.* 2007

- Responses to 4 Nef epitopes (3 HLA-DR epitopes selected with TEPITOPE software and 1 HLA-DQ epitope) were evaluated in treatment naive asymptomatic patients and long term non-progressors. 2 years later, more than half medium- and non-responders followed bi-therapy, while high responders to Nef peptides still were without antiretroviral treatment and conserved stable CD4 counts, indicating that Nef specific CD4+ response is associated with non-progression.
- Proliferative response to Nef epitopes was always associated with high IFN-γ secretion.
- AWLEAQEEEEVGF was described as promiscuous HLA-DQ epitope in Pancre2002.

HXB2 Location Nef (56–68)
Author Location Nef (56–68 HXB2)
Epitope AWLEAQEEEEVGF
Immunogen vaccine
Vector/Type: peptide *HIV component:* Nef *Adjuvant:* Complete Freund's Adjuvant (CFA)
Species (MHC) mouse (DQ2, DQ3, DQ5, DQ6, DQ7, DQ8)
Keywords binding affinity, cross-presentation by different HLA, Th1, TCR usage
References Pancré *et al.* 2002

- This highly conserved Nef epitope has promiscuous HLA-DQ class II binding potential. It has a can bind to 6 different HLA-DQ alleles, but did not bind to any HLA-DR alleles tested. It bound to DQ2 and DQ8 with particularly high affinity, and with DQ7 with low affinity.
- DQ transgenic mice (in particular DQ8) mounted strong cellular and humoral responses after immunization with this peptide.
- Ex vivo stimulation of CD4+ T-cells from 14 healthy donors (with diverse HLAs) with this peptide presented on autologous DCs resulted in Th1-associated cytokine production. IFNgamma production was stimulated in 7/14 cases, both IFNgamma and IL-2 in 6/14, and just IL-2 in 1/14. No IL-4 or IL-5 production was observed.
- Peptide-specific CD4+ T-cell clones with different HLA presenting molecules demonstrated a preference for TCR Vβ6.1.

HXB2 Location Nef (56–68)
Author Location Nef (56–68)
Epitope AWLEAQEEEEVGF
Immunogen vaccine
Vector/Type: peptide *Strain:* B clade *HIV component:* Nef
Species (MHC) transgenic mouse (DQ6, DQ8)
Assay type proliferation, HLA binding
Keywords binding affinity, computational epitope prediction
References Depil *et al.* 2006

- A combination of peptide-binding assays and HLA II transgenic mice experiments was sugggested for selecting T helper epitopes. HIV Nef peptide AWLEAQEEEEVGF and Sm28GST peptide ENLLASSPRLAKYLSNRPATPF were used as models.

HXB2 Location Nef (61–80)

Species (MHC) human
Country United States
Assay type CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining, HLA binding
Keywords supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection
References Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN-γ EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 11% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNPs responded to many peptides, comparable to acute STI.

Immunogen vaccine
Vector/Type: DNA, virus-like particle (VLP), HIV infected-cell lysate, polyepitope *HIV component:* Env, Gag, Nef, Pol
Species (MHC) human
Country Russia
Assay type T-cell Elispot
Keywords vaccine antigen design
References Bazhan *et al.* 2008

- Two immunogens were combined in the CombiHIV vac (VLP-TBI-pcDNATCI) vaccine: artificial polyepitope protein TBI, containing T- and B-cell epitopes from Env and Gag and the DNA vaccine construct pcDNA-TCI, carrying CTL and CD4+ epitopes from Env, Gag, Pol, Nef.
- Combination of two B- and T-cell immunogens resulted in increase in the antibody response (but not CTL response) to both TBI protein and the proteins from HIV-1 lysate, compared to the level of antibodies induced by immunization with either immunogen alone. The synergistic effect in the induction of B-cell-mediated response was explained by the presence of CD4+ T-helper epitopes in TCI, due to stimulation of B-cell proliferation and differentiation.
- YKAAVDLSHFLKEKGGL is a previously known epitope that is a part of TCI fragment FPVRPQVPLRPMTYKAAVDLSHFLKEKGGLEGL in this vaccine construct.

Country United States
Assay type CD4 T-cell Elispot - IFNγ, Intracellular cytokine staining, HLA binding
Keywords supervised treatment interruptions (STI), rate of progression, immunodominance, acute/early infection
References Kaufmann *et al.* 2004

- CD4 T-cell responses in 36 HIV-1 positive individuals in different disease stages were mapped by IFN-γ EliSpot using a panel of 410 B-consensus peptides spanning all HIV proteins. Virus specific CD4+ T-cell responses (median=7, range of magnitude=990) were detected in 30/36 patients.
- This peptide was recognized by 36% of the study group.
- Gag and Nef responses dominated the CD4+ T-cell EliSpot responses in the study. No correlation between plasma viremia and the frequency or magnitude of HIV-1-specific responses was observed.
- The peptides that were recognized by the most people were able to bind broadly to multiple HLA-DR molecules. This peptide showed high cross-reactive binding capacity and bound to 7/8 tested HLA-DR molecules.
- The most HIV-1 specific CD4+ T-cell responses were observed in acutely infected patients with treatment of primary infection who stopped after 1-3 treatments (acute STI), compared to patients continuing therapy. People with therapy during chronic infection had low responses; higher numbers of responses were seen among untreated people. 2/9 LTNPs responded to many peptides, comparable to acute STI.

Immunogen HIV-1 infection

T-Helper CD4+

Species (MHC) human
Country Canada
Assay type proliferation, Flow cytometric T-cell cytokine assay
Keywords memory cells
References Younes *et al.* 2003

- HIV-1-specific CD4+ T-cell responses were analyzed for 6 years since primary infection, in 10 aviremic and 8 viremic patients.
- CD4+ T cells proliferating responses were correlated with the frequency of CD4+ T cells secreting IL-2 in aviremic patients. In viremic patients, CD4+ T cell proliferative response was impaired despite of the high frequencies of IFN-γ, but not IL-2-producing CD4+ T cells in periods of elevated viremia, suggesting that long-term CD4+ memory depends on IL-2-producing CD4+ T cells and that IFN-γ only-producing cells are short lived.

- Parasitic helminthic infections in humans, common in parts of Africa and Asia, can shift immune responses to Th2 responses. To model this, BALB/c mice were infected with the parasite Schistosoma mansoni, and the infected mice showed a dominant Th2 immune response. Vaccination with gp120-depleted HIV-1 viral particles and incomplete Freund's adjuvant induced Th2 responses in these mice, but this could be shifted towards a Th1 profile when CpG oligodeoxynucleotide was added to the vaccine as an immunostimulatory agent.

Keywords HAART, ART, rate of progression
References Ghanekar *et al.* 2001

- 12 long term non-progressors (>10 years) went on HAART, while 14 elected not to go on HAART. After a year on HAART, higher frequencies and absolute numbers of HIV-specific memory CD4+ T-cells were observed in untreated patients than patients receiving HAART therapy, tested by stimulation an proliferation responses to HIV Remune antigen (gp120 depleted vaccine).
- These results indicate a control of viral replication in therapy-naive patients may be mediated by their ability to respond to recall viral antigen, and that the diminished response in treated patients may contribute to viral rebound.

References Pido-Lopez *et al.* 2002

- The thymic output in HAART-treated HIV-1 infected patients with progressive disease was studied. One patient also receiving steroid treatment therapy had a weak response in a sjTREC assay indicating a dysfunctional thymus, while four patients not on steroids had clear positive sjTREC readings after HAART. Stimulation of PBMC with multiple recall antigens including gp120, p24 and Nef and mitogens, and revealed that in the patient treated with steroids there was and induction of a Th2 type response indicated by increased levels of IL-4 secretion in response to antigen.

Keywords binding affinity, review, Th1, Th2, mucosal immunity
References Berzofsky 2001

- Vaccine clusters were constructed containing T helper, CTL aand neutralizing antibody epitopes, and used to immunize mice. Four things were found to enhance the vaccine immune response: i) increasing the affinity of the peptide for the presenting MHC molecule, called epitope enhancement; ii) increasing the avidity of MHC/peptide complex for the T-cell receptor; iii) incorporating cytokines IL-2, GM-CSF, TFN-α, or IL-12 and IL-4 which steer responses towards Th1 or Th2 responses; iv) inducing mucosal immunity specifically, with intrarectal being most effective.

T-Helper CD4+

- The first generation of HIV-1 plasmid vaccines in 167 individuals induced T-helper responses in most vaccine recipients, however CTL responses were below a 20% response rate. REV-independent RNA optimized constructs (pGag and pEnv) as well as B7 costimulatory molecules could significantly enhance CD8 effector cell responses. Co-administered GM-CSF enhanced antibody repsonses, IL-12 CTL production. IL-15 increased T cell expansion without increasing T cell help.

References Breen 2002

- HIV-1 triggers immunological dysfunction in multiple ways, including the loss of CD4-positive T helper cells in quantity and function and hyperactivity and changes in the production and activity of cytokines. The role of pro- and anti-inflamatory cytokines are discussed, including IL-10, which can suppress HIV-1, and IL-1, IL-6, TNFα which up-regulate HIV-1.

- rCD4-IgG treatment was associated with improved Th cell function measured by IL-2 production in response to alloantigen or PHA, but not to influenza (a recall antigen response), in 9/10 patients. No clinical benefit was evident. rCD40IgG was also shown to block gp120 induced suppression of Th cells *in vitro*. Proposed mechanisms include: inhibiting HIV-cell fusion by blocking the binding of gp120 to CD4, competing with free gp120 for binding to the CD4 receptor and reducing gp120 induced immunosupression, and gp120-induced direct killing of Th cells.

- Six different HIV-1 Nef peptide sets ranging in length from 15-20 amino acids with overlap from 10-11 amino acids derived from either the B clade consensus sequences or the B clade sequence B.AU.AF064676 were used to study the impact of using different peptide design strategies to detect CD4 and CD8 T-cell responses. 20 individuals were tested using the six sets of peptides. 17/20 had CD8 T-cell responses to all peptides sets, and 15 of these 17 had CD4 T-cell responses.
- Although there was a trend in detecting more CD8 T cell responses using the shorter 15-mer peptides, longer 20-mers were best for detecting more CD4 T-cell responses, but neither result was statistically significant. Similar results were seen in the 15 to 20 amino acid range for both IFN gamma Elispot and ICS assays.
- Use of the consensus versus the natural strain identified slightly increased numbers of reactive peptides. Seven reactive peptides were observed with the B consensus peptides but not the B.AU.AF064676 peptides, but on the other hand four reactivites were observed using the B.AU.AF064676 peptides but not the consensus.
- Using an overlap of 10 or 11 amino acids did not make a difference.

T-Helper CD4+

References Norris & Rosenberg 2002

- This paper reviews the role of Th cells in controlling HIV-1 infection, and in other viral infections. It describes CD4+ T-cell support of Ab production, CTL responses, as well as antiviral cytokine production and infected-cell killing. HIV+ patients with a low viral load and rare vigorous HIV-specific CD4+ proliferative responses, and the benefit of early treatment in preserving Th HIV-specific responses allowing immune control when therapy is subsequently stopped, are described.

Assay type Cytokine production
Keywords HAART, ART, rate of progression, Th1, Th2
References Nunnari *et al.* 2003

- HIV-1 positive patients co-infected the GBV-C, the hepatitis G virus, have a longer survival time to AIDs and higher CD4+ T cell counts than patients that were not infected with GBV-C. GBV-C co-infected patients showed an intact Th-1 profile over time, with high serum levels of IL-2 and IL-12, and diminishing Th-2 responses reflected by lower levels of IL-4 and IL-10. The opposite was true for HIV-1 + patients that were not co-infected with GBV-C.
- AIDs progression is slower in patients infected with both HIV-1 and hepatitis G virus. It is unclear whether Th-2 and Th-1 cytokines in co-infected patients show cause or consequence of slower AIDs progression. CD4+ cells may support hepatitis G replication.

Part IV

HIV Antibody Binding Sites

IV-A

Summary

This part summarizes HIV-specific antibodies (Abs) from the literature arranged sequentially according to the location of their binding domain, organized by protein. We attempted to make this part as comprehensive as possible. For the monoclonal antibodies (MAbs) capable of binding to linear peptides, we require that the binding site be contained within a region of 30 or so amino acids to define the epitope, but not that the precise boundaries be defined. MAbs that do not bind to defined linear peptides are grouped by category at the end of each protein. Antibody categories, for example CD4 binding site (CD4BS) antibodies, are also noted in the index at the beginning of this part. Studies of polyclonal Ab responses are also included. Responses that are just characterized by binding to a protein, with no known specific binding site, are listed at the end of each protein. For more recent updates, epitope sequence alignments, and search capabilities, please see our web site: `http://www.hiv.lanl.gov/content/immunology`.

IV-A-1 Indices

Three indices are provided. The first provides a concise list of anti-HIV-1 MAbs by cross-competition category, with both discontinuous epitopes (for example, CD4BS) and some well known linear epitopes (for example, cluster I) summarized. The second lists the MAbs' IDs in alphabetical order so one can find their location in the table. The third is a listing by order of appearance in the tables.

IV-A-2 Tables

Each MAb has a twelve-part basic entry:

Number: Order of appearance in this table.

MAb ID: The name of the monoclonal antibody with synonyms in parentheses. MAbs often have several names. For example, punctuation can be lost and names are often shortened (M-70 in one paper can be M70 in another). Polyclonal responses are listed as "polyclonal" in this field.

HXB2 location: Position of the antibody binding site relative to the viral strain HXB2 (GenBank Accession Number K03455), which is used as a reference strain throughout this publication. The numbering in this table corresponds to the protein maps. Because of HIV-1 variation, the epitope may not actually be present in HXB2; rather, the position in HXB2 indicates the position aligned to the epitope. HXB2 was selected as the reference strain because so many studies use HXB2, and because crystal structures for HXB2-related proteins are available. The precise positions of an epitope on the HXB2 reference strain can be readily obtained using the interactive position locator at our web site: `http://www.hiv.lanl.gov/content/sequence/LOCATE/locate.html`.

Author location: The amino acid positions of the epitope boundaries and the reference sequence used to define the epitope are listed as given in the primary publication. Frequently, these positions as published are imprecise, and do not truly correspond to the numbering of the sequence, but they provide a reasonable guide to the peptide's approximate location in the protein. Also, in many cases, position numbers were provided but the reference sequence identification was not. Because of HIV-1's variability, position numbers require a reference strain to be meaningful. Binding sites that cannot be defined through peptide binding or interference studies are labeled as discontinuous. The approximate location on the protein, sequence number, and reference sequence are listed.

Sequence: The amino acid sequence of the binding region of interest, based on the reference strain used in the study defining the binding site. On occasions when only the position numbers and not the actual peptide sequence were specified in the original publication, we tried to fill in the peptide sequence based on the position numbers and reference strain. If the sequences were numbered inaccurately by the primary authors, or if we made a mistake in this process, we may have misrepresented the binding site's amino acid sequence. Because of this uncertainty, epitopes that were not explicitly written in the primary publication, that we determined by looking up the reference strain and the numbered location, are followed by a question mark in the table.

Subtype: The subtype under study, generally not specified for B subtype.

Neutralizing: **L**: neutralizes lab strains. **P**: neutralizes at least some primary isolates. **no**: does not neutralize. No information in this field means that neutralization was either not discussed or unresolved in the primary publications referring to the MAb.

Immunogen: The antigenic stimulus of the original B cell response. Often this is an HIV-1 infection. If a vaccine was used as the original antigenic stimulation, not a natural infection, this is noted, and additional information about the vaccine antigen is provided as available.

Species (Isotype): The host in which the antibody was generated, and the isotype of the antibody.

Research Contact: Information about who produced an antibody, how to obtain it, or who should receive credit.

Country: The country where the samples were obtained; this is generally not specified if the study was conducted in the United States.

References: All publications that we could find that refer to the use of a specific monoclonal antibody. First is a list of all references. Additional details for some of the older references can be found in Part V, although we have tried to keep the entries self-contained since 1997.

Keywords: Keywords for antibody entries were initiated in 2004. The keywords are listed when available as part of the main entry, and also follow the note in bold type so references pertaining to particular types of studies can be found quickly.

Notes: Describe the context of each study, and what was learned about the antibody in the study.

IV-A-3 HIV protein binding site maps

The names of MAbs and the location of well characterized linear binding sites of 21 amino acids or less are indicated relative to the protein sequences of the HXB2 clone. This map is meant to provide the relative location of epitopes on a given protein, but the HXB2 sequence may not actually bind to the MAb of interest, as it may vary relative to the sequence for which the epitope was defined. Above each linear binding site, the MAb name is given followed by the species in parentheses. Human is represented by 'h', non-human primate by 'p', mouse by 'm', and others by 'o'. More precise species designations for any given MAb can be found using the web search interface or in the tables in this part.

IV-A-4 Alignments

To conserve space, no epitope alignments are provided in this book, but they can be generated using the Ab search tool at `http://www.hiv.lanl.gov/content/immunology`. The master alignment files from which the epitope alignments were created are available at our web site at `http://www.hiv.lanl.gov/content/sequence/NEWALIGN/align.html`.
